SURVEY NOTE

The Horizontal and Vertical Co-ordinates were established by Burnett Resource Surveys Ltd. under the supervision of Mr. J. Davidson, P.Eng., B.C.L.S., using CA1000 Tellurometers, Hewlitt Packard Distance Meter and Kern DKM2A Theodolites. Horizontal Co-ordinates are derived from Trig. Station 2496 Lat. 55° 09' 30.8560" Long. 121° 34' 42.2850" and Trig. Station 2350 Lat. 55° 12' 09.1870" Long. 121° 29' 36.5450". Elevations are above mean sea level and derived from Trig. Station 2496, elev. = 1915.058m and where established by trig. levelling, vertical angles being read simultaneously at both ends of each course. The field survey was executed in 1977.

RECLAMATION REPORT – COAL EXPLORATION

To be submitted in duplicate to Senior Reclamation Inspector, Victoria. *See* note at bottom of page.

1. FOR CALENDAR YEAR 19 78 PERMIT NO. 117

2. COMPANY bp Exploration Limited NAME OF OFFICIAL J. Stobernack
ADDRESS 335 Eighth Avenue S.W. SIGNATURE
Calgary, Alberta DATE SUBMITTED September 27/78

3. DETAILS OF WORK DONE AND DESCRIPTION OF RECLAMATION

Use metric measure. (1 metre = 3.3 feet). Show method of reclamation, for example, backfill of excavated earth and replacement of topsoil, seed type, fertilizer used and application, etc. Use back of sheet if required. Reference locations on 1:50,000 map (Coal Titles Reference Maps).

	Area Disturbed	Area Reclaimed
ROADS: Indicate lengths of individual roadways built and approximate width both cut and fill.	(approx. avg.)	(includes outstanding 1977 work as well as 1978)
1978 New Roads 1,757 m in length x 4 m top	____ m²	____ m²
x 6 m cut	10,542 m²	10,542 m²
1978 Reopened Roads 11,534 m in length x 4 m	46,136 m²	46,136 m²
Roads (new and reopened) 16,764 m x 6 m	- m²	100,584 m²
left over from the 1977 program		
TEST PITS:		
Nil	____ m²	____ m²
	____ m²	____ m²
	____ m²	____ m²
	____ m²	____ m²
TRENCHES: Indicate lengths, widths, and ground slope.		
50 trenches	____ m²	____ m²
approx. 6 m x 1 m - usually vertical	300 m²	300 m²
	____ m²	____ m²
	____ m²	____ m²
ADITS:		
Total No. Nil	____ m²	____ m²
DRILL SITES:		
Total No. 30	15,000 m²	15,000 m²
OTHER:		
73 drill sites and trenches left over	- m²	36,500 m²
from the 1977 program.	____ m²	____ m²
Total Disturbed and Reclaimed Area (square metres)	71,978 m²	209,062 m²
Total Disturbed and Reclaimed Area (hectares) (1 hectare = 10 000 square metres)	7.19 ha	20.90 ha

4. GENERAL COMMENTS:

All the outstanding 1977 reclamation work has been completed along with the 1978 program. Seeding which took place in July has already started to germinate particularly in the Bullmoose area, and also in parts of the 1978 reclamation area (please turn over).

NOTE: Refer to original 'Application for a Reclamation Permit' and note work done on two copies of the 1:50,000 map. Specify where work done has varied from that which was proposed. Attach to this report. Refer to booklet entitled, *Guidelines for Coal and Mineral Exploration*, available at the office of the District Inspector of Mines, for reclamation advice. Attach photographs or other support data if desired to supplement this format.

1. The following contractors were employed in the 1978 Program:

   a) Peace Oilfield Contracting Ltd. (Fort St. John) - Slashing

   b) Tompkins Contracting (1977) Ltd. (Fort St. John) - Road Construction Restoration - large scale earth moving of roads and drill sites.

   c) North Star Fabricating (Chetwynd) - Restoration - 1) small scale earth moving eg. erosion bars, scarifying of roads and drill sites. 2) seeding & fertilizing.

2. Method of Reclamation:

   a) All roads, drill sites and trenches were backfilled where required and pulled back to natural grade.

   b) Scarifying to brake up 'hard pan'.

   c) Seeding and fertilizing - see items 3 & 4 for mixture and application.

   d) Re-scarifying to cover seed and fertilizer.

   e) Formation of erosion bars.

   f) Hand seeding of erosion bars.

3. The seed mixture used in the reclamation of the 1978 Sukunka program was as follows:

   33% Creep Red Fescue (N.B. Red Top was not available at the
   22% Alsike Clover local distributor in Dawson Creek.)
   28% Climax Timothy - The Forestry Mixture left over from
   17% Carleton Bromgrass the 1977 Program was used up in 1978.

   Rate: 50 lb./acre (1 acre - ¼ mile of road)

4. A mixture of 65 lbs. Nitrogen, 65 lbs. Phosphorus and 65 lbs. Nitrogen was applied per acre.

COAL EXPLORATION FORM 7–8

665

THE GOVERNMENT OF THE PROVINCE OF BRITISH COLUMBIA

DEPARTMENT OF MINES AND PETROLEUM RESOURCES
MINERAL RESOURCES BRANCH
INSPECTION AND ENGINEERING DIVISION

NOTICE OF WORK ON A COAL LICENCE

Pursuant to section 7 of the *Coal Mines Regulation Act* this notice is to be completed by all companies or individuals carrying out exploration work prior to commencement of work, and within one month of cessation of work and one copy is to be sent to each of the following:

Senior Reclamation Inspector, Victoria
District Inspector of Mines
Regional Water Rights Engineer
District Forester or Forest Ranger
Regional Fish and Wildlife Office

PERMIT NO. 117

1. NAME OF PROPERTY: Sukunka

Coal Licence Numbers: 3089-3129, 3014-3023, 3026, 3033, 3038, 3554-3557, 3559.

2. LOCATION: Mining Division 9 Prince George B.C. NTS Map Sheet No. 93 P/3,4,5

Lat. 55 ° 11 ' Long. 121 ° 31 ' Locality and Access Sukunka - access from Chetwynd via the Sukunka Valley Road to Mile 37 (Coalition Mine Camp)

3. OWNER: Name BP Exploration Canada Free Miner's Cert. No. 166491

Address 335-8th Avenue S.W. City Calgary Prov. Alta.

4. OPERATOR: Name As above Free Miner's Cert. No. As above

Company Telephone No. (403) 266-7071

Address City Prov.

5. ESTIMATED DURATION OF WORK: From to

6. ACTUAL DATE WORK COMPLETED: Day 22 Month September 19 78

7. APPROXIMATE NUMBER OF MEN EMPLOYED: 55

8. EXPLORATION WORK: Proposed ☐ Completed ☒ (Use metric measure – 1 metre = 3.3 feet.)

Linecutting (distance, width, method)

(Requires approval of Forest Service. 'Licence to Cut' or 'Free Use Permit' may be withheld until Reclamation Permit approval.)

Drilling – No. of Sites 30 Total Area 15,000 square metres

Road Construction – Total Length 1,757 m (new road) 11,534 m (re-opened road) metres Approximate Width 4 m top, 6 m cut metres

Underground Exploration nil (type)

Trenching – Number 50 Total Length 300 metres. Width 1.00 metres

Test Pitting – Number nil Total Disturbed Area nil square metres

Work by Self ☒ OR Name of Contractor

(Owner is responsible for ensuring the Contractor complies with pertinent regulations, *see* section 8, *Coal Mines Regulation Act*.)

9. DATE FOREST SERVICE ADVISED BY OPERATOR: March 30/78 September 25/78

Name and Title of Forest Official Forest Ranger - John Hall

Address Chetwynd, British Columbia

NOTE: Pursuant to section 8, subsection 2(a) of the *Coal Mines Regulation Act*, '...where the employment of mechanical equipment is likely to disturb the surface of the land in clearing, stripping, trenching...' the Application for a Reclamation Permit on the reverse side is also to be submitted.

SUKUNKA 1978

EXPLORATION PROGRAM

Trench Description 1 of 7

665

Trenching Programme 1978

52 trenches, in 9 groupings, were cut,logged and surveyed.

Personnel responsible for logging were D.J.W. Mitchell, P.M. Caine, K. Kim, A. Chowdry, C. Bickford, L. Rindero.

Group One

Plate 2a northern crop, Upper and Lower Chamberlain Seams. No's 1-3, 7, 43.

Group Two

Plate 2b northern crop, Upper and Lower Chamberlain Seams No's 4-6.

Group Three

Plate 1 northern crop, Upper and Lower Chamberlain Seams. No's 8-18, 41.

Group Four

Plate 1 northern crop, Middle Coals Seams B to D. No's 19-24.

Group Five

Plate 2a northern crop, Middle Coals, B Seams. No's 25-28, 39.

Group Six

Plate 2a, south bank Chamberlain Creek, Upper and Lower Chamberlain Seams. No's 29-34, 42.

Group Seven

Plate 1, western crop, Middle Coals, B Seam. No. 35 (Composite of 5 trenches).

Group Eight

Plate 1, western crop, Middle coals B Seams. No's 36-40.

Group Nine

Plate 3, northern crop, Upper and Lower Chamberlain Seams No's 44-52.

Station		Description
B1		SANDSTONE - medium-grained, dark grey, slightly carbonaceous. Concretionary; (probably Bird Seam floor). Attitude 176/7 E
B2		SANDSTONE - as above; brown-weathering. Attitude 203/6 E
B3		SANDSTONE - medium-grained, dark grey, brown-weathering; chert granules; (definite base of Bird Seam). Cross-laminated. Attitude: 225/10 SE
B4		SANDSTONE - coarse-grained, dark grey to black, dark grey-weathering. (Chamberlain Seam floor). Near DDH PL-6. Attitude: 110/17 NE. Since last point, float of Geu sandstone
B5		MUDSTONE/SILTSTONE - thinly bedded and laminated. Sandstone above; 1 metre exposed of both sandstone and mudstone/siltstone units. (Chamberlain Seam roof). Attitude: 116/10 NE
B6		SANDSTONE - fine-grained; and siltstone. Sandstone is rusty-brown-weathering, thinly bedded and cross-bedded, very fine to fine-grained; argillaceous. Attitude: 120/12 NE
B7		SANDSTONE - (Chamberlain Seam floor). Coal float above. 3 metres above floor is outcrop of laminated siltstone/mudstone, 50 cm thick, overlain by orange-weathering, very fine to fine-grained sandstone.
B8		SANDSTONE - fine-grained to medium-grained, massive, red-orange-weathering. Forms cliff running up slope to SE. Attitude: 135/8 NE. Another outcrop of sandstone at ± 1200 m.
B9		SANDSTONE - very fine-grained. Orange-weathering, slightly carbonaceous, argillaceous. Plant debris. Finely laminated Outcrop in creek; attitude: 125/4 NE

B15		SANDSTONE - medium-grained, dark grey, grey-weathering, salt-and-pepper. (Bird Seam floor). Attitude 031/10 SE. Near DDH PL-13
B16		SANDSTONE - medium-grained, cross-bedded. Orange-grey-weathering. Attitude: (May be on cross-bed) 088/14 S
B17		SANDSTONE - fine-grained to medium-grained. Orange-weathering. Chert pebbles; One quartzite pebble; on bedding plane. Smooth bedding plane forms surface of outcrop. Attitude: 031/10 SE
B18		SANDSTONE - as above; (below Bird Seam). Fossil locality: one Pelecypod sampled (in place): B18F. Four more Pelecypods seen in rubble near outcrop. Near seismic line. Attitude: 040/12 SE.
B19		SANDSTONE - medium grey, orange-weathering. Fine-grained. At DDH PL-10. Attitude: 122/10 SW.
B20		SANDSTONE - (as before). Road follows dip slope of this sandstone. Since B18, traversed over an anticline. Attitude: 129/11 SW.
B21		SANDSTONE - fine-grained to medium-grained, medium-grey. Outcrop in bank above DDH PL-23. Attitude: 165/23 SW.
B22		SANDSTONE - in bank above road. Attitude: 130/20 SW. (as above).
B23		SANDSTONE - fine-grained. Overlies slightly silty mudstone. Sandstone is 1 metre thick; mudstone is 1.5 metres thick; (may represent a "laminite" unit).
B24		SANDSTONE - dark grey to black; medium-grained. (Chamberlain Seam floor); 2 metres exposed. Attitude: 100/16 SW.
B25		SANDSTONE - medium-grained; orange-weathering; dark grey. Disseminated carbonaceous fragments. Cross laminated, with pin-prick burrows. Attitude: 066/3 SE

B26		SANDSTONE - medium-grained, medium grey, quartz-lithic. Since last point, nearly continuous outcrop along road, (on same bedding surface as B25). Dip rolling over to west and steepening. (indicating passage down anticlinal limb). Attitude: 155/16 SW.
B27		COAL - weathered, powdery texture. Near DDH PL-17.
B28		Trench exposing Lower Chamberlain Seam with roof and floor.
		Section in trench wall:
		ROOF - 4.0 m total thickness: siltstone/vfg sandstone, grading to: mudstone, grading to: siltstone/mudstone "laminite". COAL - Lower Chamberlain Seam, 1.8m thick. FLOOR - Sandstone, dark grey to black; carbonaceous Medium to coarse-grained, quartz-lithic
		Attitude of seam: 080/4 SE
B29		SANDSTONE - (Chamberlain Seam , floor as above. Since last point, following floor.) Attitude: 082/6 SE and 035/7 SE ; floor is uneven.
B30		SANDSTONE - (as above). Large flat bedding plane, (about 0.3 m below Chamberlain Seam floor level); attitude: 072/6 SE.
B31		SANDSTONE - as above,) on large dip slope. No evidence of faulting; rather, near-continuous outcrop describes a synclinal flexure. Attitude: 111/17 SW
B32		SANDSTONE - very fine to fine-grained. Abundant plant fragments. (Probably forms top of "laminite" succession between Skeeter and Chamberlain SEams.) Argillaceous.
B33		SANDSTONE - (as above). On road below seismic line. Abundant plant debris. Attitude: 142/14 SW
B34		SANDSTONE - medium-grained, quartz-lithic. (Chamberlain SEam floor), on dip-slope. Northern limit of outcrop not seen. Attitude: 111/16 SW

B44		SANDSTONE - very fine-grained, medium grey orange-weathering. Remarkably clean. Parallel to low-angle lamination. Large shaly intraclasts. 1.5 metre bed. Small Pelecypods on base of bed. Stratigraphically upright. Attitude: 013/70 E, at base of shell bed; 180/56 E in very fine-grained, platy sandstone and shale about 10 m south of B44, and about 5 metres stratigraphically higher.
B45		SANDSTONE - medium to coarse-grained, dark grey, rusty-weathering, very hard and siliceous or cherty, wtih distinct orange specks. Sheared and shattered, "cooked" appearance. Numerous thin veinlets of calcite; argillaceous and carbonaceous, with plant impressions. Distance contrast between this unit and that at B44. Sandstone is 5 to 6.5 m thick.
		Sharp upper contact with dark grey, carbonaceous shales, silty at base. Estimated 1 metre thick. (Abrupt change in dip and rock type suggests a fault between B44 and B45, following gully between the two outcrops.) Gully trends 040°, slope angle +21°.
		Note: the term "cooked" is used to describe a siliceous, quartzose sandstone of distinctive appearance, characterised by apparent welding of grains, and extremely hard and splintery nature. No metamorphic connotation is intended.

B46		SHALE - weathered, dark grey. Rubbly to blocky, devoid of lamination, silty and perhaps pyritic. To southeast of B44, on road.
B47		SANDSTONE - conglomeratic, dark grey, tought (as at B45); and carbonaceous shale. Sandstone about 2 metres thick, with shale above. Attitude: 012/80 E. To northwest of B45, on road.
B48		SANDSTONE - medium-grained, dark grey, resistant, siliceous, (similar to that at B45). Cross-bedding and scours indicates tops up. Attitude: 172/67 E
B49		MUDSTONE - dark grey, silty, carbonaceous. Bedding rolls, strike is constant, but dip varies. Attitude: 160/50 to 80 E.
B50		SANDSTONE - dark grey, siliceous, and mudstone - dark grey, carbonaceous. Exposed as float blocks in road surface.
B51		SANDSTONE - very fine-grained, thinbedded, parallel laminated, fossils at base seen only in float blocks; (Mytlius sp.) Trace fossils on bedding in place, probably worm trails. Large shaley intraclasts. Compare to B44. Orange-weathering. Attitude: 150/42 W
B52		SANDSTONE - orange-weathering, laminated. Fossiliferous; Pelecypod collected, no. B52 F. Exposed only as float blocks, along road since B51. (FLoat probably derived from GEL outcrops above road).
B53		SANDSTONE - fine to medium-grained, brownish-grey, orange-weathering. Attitude: 041/6 SE
B54		MUDSTONE - medium grey, light grey-weathering. Beds from 2 cm to 15 cm, with thicker beds less common. (Below stratigraphic level of B53). Spheroidal weathering; rubbly. Small dark burrows. Sample B54F: small burrows, with possible pelecypod. Attitude: 120/24 SW
B55		SANDSTONE - fine-grained, orange-weathering. Argillaceous. Pelecypods accompany a band of dark chert granules. Float Sample B55F

B68		MUDSTONE - dark grey. Attitude 157/16 SW
B69		SANDSTONE - dark grey, fine to medium-grained; quartz-lithic. (Below Bird Seam) Attitude 107/16 SW. Uneven bedding surface.
B70		SANDSTONE - fine-grained, massive, medium grey. Forms 3 m waterfall. Attitude: 080/2 SE
B71		SANDSTONE - medium-grained, medium grey, calcaroeus. Attitude: 115/24 SW
B72		SANDSTONE - fine-grained, medium brownish grey, light brown-weathering, argillaceous, calcareous; wavy bedding; plant material. Attitude: 138/7 SW
B73		COAL - exposure in east bank of creek. Coal about 2 metres thick, overlain abruptly by massive sandstone. (Coal is interpreted to be the Skeeter Seam). Coal is frozen, sheared, and pulverised. Floor of seam exposed at north end of outcrop: siltstone - dark grey, orange-weathering.
B74		SANDSTONE - medium-grained, dark grey, quartz-lithic. (Chamberlain Seam floor); forms ledge across creek. Chamberlain Seam is suspected to lie between this sandstone and the overlying dark grey siltstone. Attitude: 143/22 SW
B75		SANDSTONE - fine-grained to medium-grained, blocky. Attitude: 163/17 SW
B76		SANDSTONE - platy. Since last point, sandstone has become finer and has ubiquitous lamination. Attitude: 161/44 SW. 30 cm down creek from B76, sandstones are intensely crumpled and broken. (Fault, probable.) Top plate of fault shows thick-bedded (GEL) sandstone, and bottom plate shows platy sandstone as at B76. Attitude of fault plane: 163/30 SW. Photographs taken showing fault and associated crumpling and folding. Minor anticline on west side of creek, opposite fault exposure, is 3 m wide at water line.

B120		MUDSTONE - dark grey, strongly silty. Peruasive near-vertical cleavage not dewatering fractures. Prominent orange-weathering bands, parallel to bedding and lamination. Elongate, elliptical concretions, parallel to cleave; containing pyrite and rust-weathering small and large burrows. Cleavage and concretions contribute to appearance of vertical bedding. Tiny dark burrows in non-concretionary portion. (probably Lower Gething marine sequence .) A thin stringer of coal squeezed in along crumpled bedding. Small, pyritized burrows and plant specks. Orange bands are strongly calcareous Unit is siltier at base, with more siltstone laminae. Fossil, indistince, B120F. Attitude: 122/12 NE. Cleavage: 161/85-90 NE. Bedding steepens to west. (The strong cleavage and crumpling of this unit, increasing to the west, suggest a thrust fault between this unit and the sandstone conglomerate unit to the west. A similar relationship was seen at B44 to B47, 75 m NE and uphill.)
B121		SANDSTONE - very fine-grained, laminated, plant fragments. Carbonaceous mudstone, 1 metre, at top. Gradational into (marine) mudstone of B120. No evidence of a fault between B120 and B121. Ripple cross-lamination establishes tops to east. Attitude: 016/84 overturned to NW.
B122		MUDSTONE as at B120 and sandstone as at B121. Pebbly sandstone lenses in sandstone; also shelly fossils. Specimen B121F. 10 metres above road.
B123		SANDSTONE - medium to coarse-grained; conglomerate, conglomeratic sandstone; thin bands of sheared coal and carbonaceous siltstone and mudstone. Extensional fractures in massive sandstones; bedding near-vertical; tops not known.
		Section at B123, from west to east:
	WEST	CONGLOMERATE - pebble (ave. 5 to 10 mm; max. 30 mm) grading eastwards to granules and coarse-grained (minor medium-grained) sandstone. Individual beds 1.0 to 1.5 m thick.
	8.3¼ m	Westward 3 m dominantly sandstone and granules. Eastward 5 m dominantly pebble conglomerate. Pebbles of light and dark grey chert, few quartzite pebbles. Matrix dominantly non-calcareous, coarse-grained sandstone, as are sandstone beds at west. Slickensides on bedding surfaces. Abrupt. Attitude: 157/85 - 90 E Tops?

	0.67 m	SILTSTONE, argillaceous/MUDSTONE, silty - light grey, yellow-orange weathering. Thin bedded, rooty, non-calcareous. Attitude: 147/28 SW.
	2.78 m	MUDSTONE - dark grey, locally carbonaceous, rubbly. Abrupt.
	2.21 m	SANDSTONE - very fine-grained, dark grey, yellow-weathering calcareous. Beds 30 cm thick, separated by 4 to 5 cm mudstone bands.
	0.30 m	MUDSTONE - dark grey, medium grey-weathering. Highly silty.
	0.54 m	SANDSTONE - very fine-grained, dark grey, yellow-weathering, calcareous.
	0.18 m	COAL - thin mudstone partings.
	0.15 m	MUDSTONE - carbonaceous
	0.20 m	COAL
	0.37 m	MUDSTONE - carbonaceous, highly sheared.
	0.80 m	COAL - sheared.
	1.75 m	MUDSTONE - dark grey, very silty, carbonaceous
	0.25 m	MUDSTONE - rusty "reworked" with rusty tubes with inner canals (rootlets ?) (possible paleosol).
	1.05 m	MUDSTONE - dark grey, very silty, carbonaceous.

R1		SANDSTONE - fine-grained, medium-dark grey, orange-weathering minor crossbedding, strongly calcareous. 2-3 m thick, forming a steep slope. Attitude: 142/10 SW.
R2		GRITSTONE - coarse sand to granular, float, medium grey, siliceous. Chert pebbles.
R3		SANDSTONE - as at R1. Attitude: 118/10 SW
R4		SANDSTONE - fine-grained, medium-dark grey, red-brown weathering, massive, cherty, strongly calcareous.
R5		MUDSTONE - silty, medium brown-grey, strongly calcareous, few burrows, 0.5 m thick
		SILTSTONE - medium grey, thinly laminated, strongly calcareous, plant debris. Attitude: 103/12 SW
R6		SANDSTONE - very fine-grained, medium-dark grey, light brown weathering, silty interbeds. Thinly laminated, thinly bedded, strongly calcareous.
R7		MUDSTONE - grey-brown, slightly silty, rubbly. Small dark burrow. (Definite Lower Gething marine sequence).
R8		SANDSTONE - with finely broken plant debris. Fine-grained medium grey, orange-weathering. Thinly laminated thinly bedded, calcareous. (Between A and B seams). Attitude: 159/40 SW

B214		FAULT TRACE - exposure approximately 75 m south of road junction near Milepost 6 of No. 1 Mine Road Fault plane attitude: 124/54 SW. (Probable Chamberlain Fault).
B215		SANDSTONE - float, very fine-grained, orange-weathering clean, laminated, strongly calcareous.
B216		SANDSTONE - float, abundant angular blocks, fine to medium grained, dark grey, medium-grey-weathering, clean, massive Non-calcareous, with log impressions.
B217		SANDSTONE - fine to medium-grained, dark grey, light grey-weathering, distinctly cherty, non-calcareous, with quartz veinlets in some float blocks. Red-weathering siliceous, slickensided coatings on joints. Abundant rubble along line since last point and also upslope, of this rock type, (which resembles sandstone from below the Lower Gething "C" horizon.) Also some rubble of dirty, "cooked", carbonaceous sandstone. Attitude: 058/42 SE.
B218		SANDSTONE- float, fine-grained, orange-weathering. Clean, platy, cross-bedded, strongly calcareous. (Definitely sandstone below Chamberlain Seam). Since last point, gentle, swampy topography, no outcrops. (Fault, defined (Chamberlian Fault) on the basis of abrupt change in lithology and stratigraphic level since last point). Attitude: 109/6 SW.
B219		MUDSTONE - carbonaceous to coaly, float, and sandstone, very fine - grained, float, argillaceous, laminated, plant debris, sporadically strongly calcareous. (NOTE: August 4, 1978: Probably Lower Gething "B" horizon).
B220		SILTSTONE - dark grey, orange-weathering, strongly calcareous interbedded with mudstone. Plant debris, rubbly. Tops not known; attitude: 165/90. (Possible fault somewhere in vicinity, based on high dip at this point).
B221		COAL BLOOM - associated with chips of hard, strongly calcareous siltstone/ mudstone, and blocks of hard dark grey fine-grained siliceous sandstone. (Possibly Lower Gething "C" Seam).
B222		see next page
B223		SANDSTONE - very fine to medium-grained, dominantly fine-grained. Poorly sorted. Few granular, intraclastic, and

		"wood chip" horizons. Siliceous, with quartz veinlets. Attitude: 157/43 SW. (location approximate) Since last point, rubble of strongly calcareous sandstone.
B224		SANDSTONE - fine-grained, medium grey, reddish-weathering platy, cross-bedded, clean, strongly calcareous. Attitude: 109/7 SW.
B225		SANDSTONE - fine to very-fine-grained, as above. Float.
B226		SANDSTONE - fine to very fine-grained, as above. Float.
B227		SANDSTONE - fine to medium-grained, medium grey light brownish rusty-weathering. Strongly jointed and strongly calcareous. Thick-bedded with low and high-angle cross-lamination Rusty calcite films on joints. Attitude: 113/12 NE.
B228		SANDSTONE - fine-grained, dark grey, rusty-weathering. Strongly calcareous; abundant calcite on joints. Rubble and blocks. Some broken carbonaceous mudstone and rooty siltstone. Generally fragmental and broken with high southerly dips, shearing and small-scale-folding. (Fault, indicated, to south of the point.)
B222		SANDSTONE- very fine grained, dark grey, light grey- weathering, small-scale cross-lamination. Blocky to rubbly, calcite veins. (Possible roof of "C" Seam.) Attitude: 125/49 S.W.

B229		SANDSTONE - float, medium-grained, medium grey. Large-scale cross-lamination muddy clasts, strongly calcareous Probably between "B" and "C" horizons).
B230		SANDSTONE - fine-grained, medium to dark grey, medium gray-weathering, strongly calcareous. Small-scale cross-laminae to 1 cm. Fine stringers of silt along cross-lamination planes. Thin-bedded. Attitude: 141/47 SW.
B231		SANDSTONE - fine to medium grained, quartz-lithic, with abundant orange-weathering specks. Non-calcareous. Dominantly quartz.. minor chert. Thin-bedded, with large-scale, low-angle cross-bedding. Light grey-weathering (May be correlative with the riverine sandstone seen at B131.) Attitude145/28 SW.
B232		SANDSTONE - medium-grained, orange-grey, medium grey weathering. Medium-bedded, low-angle cross-lamination. Non-calcareous, quartz-lithic, with orange-weathering specks. Dominantly chert; hence darker than last outcrops. Attitude: two measurements: 165/43 SW 162/38 SW.
B233		Conglomerate-pebble, and coarse-grained, conglomeratic sandstone. Estimated 3 + m thick.
B234		SANDSTONE - fine to medium-grained. Light grey clean, hard and siliceous. Dominantly quartz (85 to 90%), chert (1 to 15%), Chert grains appear to be finer than quartz grains. No orange specks. Massive, blocky. Appears to be in place. Few blocks of pebbly sandstone. Attitude: 177/9 SW.
B235		conglomerate - pebble. Massive. Attitude: 124/12 SW. 130/15 SW, 155/15 SW.
B236		SANDSTONE - very fine-grained, small-scale cross-laminated, thin-bedded, silty, argillaceous laminae, plant debris, strongly calcareous. Attitude: 159/45 SW. Rusty-weath.
B237		SANDSTONE - fine to medium-grained, dark brown-grey weathering, quartz-lithic, strongly calcareous. Disseminated orange specks; large plant impressions. Alternately clean and argillaceous. Attitude: 172/24 SW.
B238		COAL BLOOM - and float of weathered, carbonaceous mudstone.

B.P. CANADA LTD. COAL GROUP

TRAVERSE / TRENCH NUMBER: Middle Coals Seismic Lines No. 2
PROJECT: _____ . DATE: _____ .
LOCATION: _____ . ELEVATION: _____ .
GEOLOGIST: _____ .

B239		SANDSTONE - very fine-grained, light grey light grey-weathering thin-bedded, strongly calcareous. Finely broken carbonized plant debris on bedding surfaces. Attitude 137/35 SW/
B240		SANDSTONE - float fine-grained, dark grey, thin bedded, strongly calcareous; no plant debris. (Compare to B230).
B241		SANDSTONE - medium to coarse-grained, conglomeratic and pebbly phases; siliceous. Sandstone dominantly clean and quartzose. Massive, 4 m thick. Attitude: 139/26 SW.
B242		SANDSTONE - medium to coarse-grained, light to medium grey. light grey-brown-weathering, very lcean. Low-angle cross-lamination, thick-bedded to massive and blocky. Log impressions, coaly inclusion, orange-weathering specks. Siliceous. Pebble phases- 0.005 to 0.040 m clasts in a matrix of medium to coarse-grained sandstone. Poorly sorted, to 22 cm thick Attitude: 062/9 SE.
		At north end of outcrop, slickensides abundant quartz Veining and disturbed bedding; attitude: 159/58 SW (Probable minor fault).
		Continuing southerly along outcrop, rapid horizontal and vertical changes in lithology, including: quartz-chert propertions, bed thickness, siliceous or calcareous cement, sorting, intraclasts, orange specks, log impressions, and grain size (from mg to conglomerate). (Such rapid changes suggest and upper-fluvial environment.)
B243		SANDSTONE - fine to coarse-grained, with conglomeratic phases. Thin to thick-bedded. Medium grey, light to medium grey-weathering. Siliceous. Locally with orange-weathering specks. Attitude: 150/66 SW. Tops up. Conglomerate is thick-bedded.
		At north end of outcrop 20 m N of the last measurement outcrop of medium-grained, sandstone with interbeds of dark grey, "cooked" siltstone, also siliceous. Attitude: 159/85 to 90 SW.
		(Low angle cross-bedding at south end of outcrop suggests overall "riverine" environment).

Dip °	DEPTH m	THICKNESS m	DESCRIPTION
			UPPER GETHING, UPPER PLATE
	60.1 65.85	5.75	START CORING SANDSTONE - fine-grained, medium grey, clean, well-sorted. Well-defined medium to large-scale, low-angle cross-lamination. Dark grey mudstone band, erosional at base; top ground out from 65.17 to 65.21 m. Calcite from 64.77 to 64.97 m (12° CA); 65.16 m (76° CA); 65.17 m (crystals to 0.001 m, 50° CA) 65.30 to 65.50 m (6° to 15° CA). Unit very strongly calcareous throughout; abrupt at base. Core loss at top: 0.88m
13° at 7° at	71.64 65.89 68.75	5.79	SANDSTONE - fine to very fine-grained/MUDSTONE (65:35)- interbeds of sandstone (0.01 to 0.44 m thick) and mudstone (0.01 to 0.09 m thick); with sharp, erosional contacts at base of sandstone, gradational upward to mudstones. Sandstones are light to medium grey, argillaceous, strongly calcareous, with small-scale low-angle and trough cross-lamination. Local small dark worm burrows. Mudstones are dark grey, slightly silty, with low-angle silty lamination. Moderately calcareous, with small sand-filled worm burrows. Medium to coarse-grained clean sandstone from 71.33 to 71.43 m; 30% coarse sand grains in mudstone from 71.43 to 71.50 m; coarse sand to granules, from 71.54 m to base. Abrupt at base. Slickensides and calcite in mudstone at 66.05 m (75° CA), 66.16 m (75° CA), 66.26 m (78° CA). Calcite veinlets from 67.90 to 68.01 m (68° CA, displaced by set at 12° CA, displaced by slickensided fracture at 60° CA), and from 68.29 to 68.43 m (near parallel to CA). Calcite at 68.80 m (78° CA). Pelecypod fossils from 69.73 to 70.04 m (specimen # BP S19 /F1)
5° at 13° at	91.12 85.84 81.88	19.48	SANDSTONE - fine-grained, medium grey, clean, well-sorted, large-scale low-angle lamination throughout, well-defined except from 71.64 to 72.54 m, where mottling is evident. Sporadic flat, dark grey mudstone intraclasts from 76.79 78.86 m; concentration of spheroidal, dark grey mudstone intraclasts from 80.71 to 80.74 m. 50% mudstone as laminae from 81.85 to 81.95 m. Sporadic intraclasts from 84.75 m to base. 5% mudstone bands below 87.65 m. Dark-rimmed worm burrows, medium sized (0.002 m), throughout. Unit very strongly calcareous throughout. Calcite from 72.86 to 73.11 m (10° CA), 75.08 to 75.16 m (12° CA). Rough, dark grey stylolite from 75.31 to 75.38 m (45° CA). Calcite from 75.72 to 76.60 m (dominantly at 10° to 30° CA, and 82° CA). Curved, slickensided fracture from 81.89 to 82.01 m (0° to 30° CA). Calcite from 81.96 to 82.11 m (13° CA). Core broken with calcite (50° to 90° CA) from 86.24 to 87.36 m. Fault, possible. Core broken from 87.67 to 88.13 m, with some calcite, but less marked distrubance than between 86.24 and 87.36 m. Core broken, with slickensides and calcite from 90.59 to 90.67 m (72° CA). Abrupt.

8° at	94.49 91.33	3.37	SANDSTONE, very fine-grained/MUDSTONE (55:45)- light grey, very strongly calcareous sandstone with interbeds of dark grey calcareous mudstone. Sandstones, low-angle cross-laminated, abrupt to erosional at base, grade up to mudstone Scattered small dark worm burrows in mudstone; medium (0.002 m) light, sandy worm burrows and large (up 0.025 m) pelecypod burrows throughout. Calcite at 91.33 (90° CA).
10° at 6° at	93.55 94.49		
5° at	107.01 99.55	12.52	MUDSTONE/SANDSTONE, very fine-grained (70:30) - interbedded from (0.01 to 0.10 m) light to medium grey, low-angle and ripple cross-laminated strongly calcareous clean sandstone and dark grey, silty, strongly calcareous mudstone Abundant small (0.001 m) worm burrows and large (0.020 m) pelecypod burrows. Sandstone component becomes less abundant and markedly argillaceous towards base. Rough joint with calcite, 98.54 to 98.62 m (30° CA). Slickensides and calcite at 101.44 m (79° CA). Gradational at base. Small pyritized pelecypod fossil at 102.57 m (specimen # BP S19/F2).
11° at	116.87 107.56	9.86	MUDSTONE/SANDSTONE, very fine-grained (95:5) - dark grey, strongly calcareous, silty mudstone with small dark worm burrows and scattered pyrite flecks, interbedded with light medium grey, clean, low-angle cross-laminated very strongly calcareous sandstone. Sandstones abrupt at base, gradational at top, with some vertical pelecypod burrows. Calcite from 111.70 to 111.76 m (45° CA), and at 112.17 m (83° CA). Core broken and ground at 108.2 and at 113.9, no calcite or slickensides noted. Calcite from 114.79 to 114.84 m (38° CA), and 116.65 to 116.66 m (70° to 85° CA). Abrupt at base.
12° at	115.81		
	120.27	3.40	SANDSTONE, very fine-grained/MUDSTONE (90:10 - grading down to 70:30 at base) - medium grey, dominantly argillaceous (locally clean) low-angle, medium-scale cross-laminated sandstone, with interbedded dark grey silty mudstone. Local concentrations of small dark worm burrows, large (0.003 to 0.004 m) light worm burrows and pelecypod burrows. Bedding locally obliterated by intense bioturbation. Strongly calcareous throughout. Calcite from 117.20 to 117.28 m (26° CA), 117.26 to 117.35 m (30° CA), 117.89 to 117.86 m (30° CA), 118.79 to 118.77 (40° CA), 118.99 m (75° CA). Rough, rusty joint with trace of calcite from 119.06 to 119.23m (15° CA). Calcite from 119.10 to 119.22 m (22° CA), and from 119.17 to 119.26 (26° CA). Rough rusty joints from 119.71 to 119.76 m (45° CA) and from 119.80 to 119.87 m (42° CA). Calcite at 120.03, 120.05, and 120.08 m (72°, 85°, and 85° CA). Abrupt base.
	123.20	2.93	MUDSTONE/SANDSTONE, very fine-grained (95:5) - dark grey silty mudstone with thin, widely spaced (0.005 m, at 0.10 m) interbeds of medium grey, argillaceous sandstone. Ubiquitous small dark burrows; general intense bioturbation.
12° at	123.30		

BH Nos. BP S19.

Dip °	DEPTH m	THICKNESS m	DESCRIPTION
			Strongly calcareous throughout; gradational at base.
	132.50	9.30	MUDSTONE - dark grey, homogeneously silty, strongly calcareous throughout. Rubbly, strongly jointed. Pyritic flecks throughout. Calcite from 123.09 to 123.15 m (41° CA) Calcite-filled mudstone breccia from 123.40 to 123.43 m. Calcite at 123.50 m (90° CA), 123.94 m (72° CA), 123.95 m (80° CA), 128.39 m (60° CA), 128.61 m (80° CA), 130.54 to 130.60 m (tension fracture fillings 40° to 50° CA); calcite from 130.64 to 131.34 (numerous near-parallel fracture fillings 45° to 75° CA). Core broken from 131.72 m to base; core loss (estimated) 0.40 m at base. Some calcite tension fracture fillings in broken core near base. Unit in fault contact at base.
	MIDDLE	GETHING	
			FAULT, ESTABLISHED
			UPPER GETHING, LOWER PLATE
	134.41	1.91	BRECCIA - calcite-veined fragments of fine and medium-grained light grey sandstone, in a sheared matrix of dark grey mudstone and calcite. Fault defined by brecciation and lithologic change across fault. Broken at base. *Coaly smudge on some joint surfaces possibly squeezed along fault from Bird Seam. Core loss 1.24m at top.
10° at	147.00 134.60 m	12.59	SANDSTONE - light to medium grey, fine-grained, clean, well-sorted. Fine to medium-grained (with medium-grained phases) from 136.14 m to top. Large-scale, low-angle cross-lamination. Strongly to very strongly calcareous throughout. From 137.73 m to top, local concentrations of faintly dark-rimmed worm burrows, from 0.003 to 0.004 m diameter. This interval generally mottled, but individual burrows are only vaguely recognisable. From 136.21 m to top, core increasingly broken, with calcite and slickensides at 75° and 80° CA, and 10° to 20° CA (offset by the 75° to 80° set). Calcite from 136.56 to 136.76 m (15° CA), 141.56 (68° CA), and from 141.42 to 141.74 (24° CA), at 90° to 68° Set.) Calcite from 141.87 to 142.33 m up to 0.005 m thick (48° CA), 0.05 to 0.10 m apart, and at 10° to 20° CA, displaced by set of 48° CA. Calcite near parallel to CA, from 142.33 to 142.93, and from 142.79 to 142.86 m (32° CA), up to 0.005 m thick. Calcite from 142.86 to 142.99 m (25° CA), and from 143.36 to 143.52 (10° CA). Calcite near parallel to CA, from 145.75 to 146.26, and from 146.71 to 146.99. Erosional at base.
	152.02	5.02	SILTSTONE/MUDSTONE/SANDSTONE, very fine to fine-grained (60:30:10) - Interbeds of light to medium grey clean, low-angle cross-laminated sandstone, abrupt at base, grading upward to medium grey siltstone and dark grey, silty mudstone,

BH Nos. BP S19

Dip °	DEPTH m	THICKNESS m	DESCRIPTION
	6° to 12°		with abundant small dark horizontal worm burrows throughout. Medium (0.003 m) dark rimmed worm burrows and vertical pelecypod burrows scattered throughout. Lower half of interval generally churned and bioturbated. Strongly calcareous throughout. Slickensides and calcite at 148.19 m (88° CA). Abrupt at base.
	153.00	0.98	SANDSTONE - fine to coarse-grained, as discrete, clean well-sorted laminae and beds, from 0.002 to 0.20 m thick. Approximately 50% of interval is coarse-grained; rest is dominantly fine with some very fine and medium-grained
10° at	152.04 m		sandstone. Medium grey, strongly calcareous throughout. One 0.01 m band of dark grey mudstone, 0.02 m below top. Slickensides and calcite at 0.18 m (77° CA), 0.26 m (78° CA), 0.28 m (85° CA), and 0.38 m (78° CA) below top.
	156.20	3.20	SANDSTONE, very fine-grained/SILTSTONE (75:25) grading down to silstone/mudstone (50:50) grading down to mudstone-laminated sequence, fining-downward, of light to medium grey, strongly calcareous sandstone, medium grey moderately calcareous siltstone, and dark grey, weakly calcareous, slightly silty mudstone. Lower 0.09 m carbonaceous. A few calcite veinlets at 55°, 80°, 85°, CA, concentrated within mudstone phases. Abrupt at base.
	166.97	10.77	SANDSTONE - fine to medium-grained, medium grey, clean, well-sorted, moderately calcareous throughout.
5° at	156.32 m		Argillaceous laminae in top 0.30 m. Faint, dark-rimmed worm burrows (0.003 to 0.004 m) from 158.33 to 158.37.
8° at	161.25 m		Medium to large-scale, low-angle cross-lamination in top 4.0 m; small-scale low-angle and ripple cross-lamination below, to base, except basal 1.52 m, which consists of
12° at	161.69 m		medium to coarse-grained clean sandstone with large-scale low-angle cross-lamination. Faint, dark-rimmed worm burrows (0.003 to 0.005 m) from 163.65 to 164.01.
5° at	162.57 m		Core badly broken between 158.46 and 160.12. Recovery
4° at	166.17 m		0.30 m. Core loss: 1.36 m. Broken pieces covered with calcite films. Within the 1.50 m interval below this broken ground, some calcite at 5°, 32°, 38°, 48°, and 62° CA. From 161.59 to 162.00 sheared coaly partings in otherwise clean sandstone. Core broken in part, abundant calcite parallel to care axis, probably slump structure. Unit abrupt at base.

	3.00	3.00	Overburden - no core
			GATES MEMBER
	3.14	0.14	Core Loss
7 at top 11 at base	19.20	16.06	SANDSTONE - medium-grained, medium grey, rusty orange-weathering along joints. Dominantly cherty (70%, quartz 30%). Weakly calareous throughout; strongly calcareous patches, especially in rusty bands near joints. Clean, well-sorted, laminated, locally medium-scale cross-laminated. Pebbles (0.002 to 0.005 m) from 6.99 to 7.02, and from 6.61 to 6.63. Mudstone, dark grey, slightly silty, from 18.90 to 18.95, passing to enclosing sandstones by convoluted interbeds. Sandy, medium (0.003 m) burrows from 18.90 to 18.95 ; large (0.005 m) burrows from 3.33 to 4.66. Joints, rusty, strongly calcareous, from 3.5 to 8.0 (60^{o} to 90^{o} CA), and from 14.0 to 18.0 (0^{o} to 30^{o} CA). 0.08 m thick, very rusty band (70^{o} CA) with clayey gouge at 15.21, very strongly calcareous.
12 at 21.40	27.07	7.87	SANDSTONE/MUDSTONE (60:40) - sandstone, fine-grained to medium-grained, medium to dark grey interbedded with dark grey to black mudstone. Sandstone is locally clean and finely laminated , more commonly finely interbedded and laminated with mudstone. Bedding locally convoluted and churned. Small (.001 to .002 m) dark burrows and large (.002 to .004 m) sandy burrows. Sandstone is weakly calcareous, mudstone is non-calcareous. Local cross- lamination and erosional features. Muddy intraclasts in clean sandstone from 21.31 to 21.35 m. Bright coaly bands with pyrite at 24.31. Coaly stringers at 24.92 and 25.44. Abrupt.
	27.19	0.12	CONGLOMERATE - pebbles to 0.012 m floating in hard, dark argillaceous siltstone. Pebbles rounded, dominantly of dark grey chert, with a few, smaller, of white quartzite and coarse dark grey chert sand. Traces of pyrite in matrix. Non-calcareous; poorly sorted. 0.002 m bright coaly lens at base. Abrupt.
	27.39	0.20	MUDSTONE - dark grey, homogeneous, soft. Two thin (0.003 to 0.004 m) lenses of fine-grained, medium grey sandstone. Several well rounded dark chert pebbles at base, (0.010 to 0.020 m diameter). Moderately calcareous. Abrupt.
	27.86	0.47	COAL - Gates "B" Seam, 0.34 m, sheared, pulverised and broken at base. Abrupt. Coreloss: 0.13 m

BH Nos. BP 42

Dip °	DEPTH m	THICKNESS m	DESCRIPTION
	31.70	3.84	SILTSTONE, argillaceous/ SANDSTONE, very fine to fine-grained/MUDSTONE (60:15:25)-medium to dark grey, gradational between lithologies, medium-scale cross-lamination. Locally darker grey, carbonaceous mudstone with listricated coaly bands. Mudstone concentrated between 27.70 and 29.01 and 31.39 to base. Plant debris, mostly finely broken and carbonized, with some large plant fragments partially replaced by pyrite. CORE LOSS at base 0.10 m.
	32.00	0.30	MUDSTONE - dark grey, carbonaceous, listricated, broken. CORE LOSS in this interval, 0.15 m.
	33.44	1.44	MUDSTONE - dark grey, carbonaceous, listricated. Finely broken plant debris. Broken at top. CORE LOSS at top 1.00 m. Abrupt. Interval from 31.70 to 33.44 is Gates "A" horizon.
3 at 39.69	45.38	11.94	SANDSTONE - medium-grained, medium grey, clean, well-sorted dominantly cherty (65%, 35% quartz). Weakly calcareous to 35.73 m, moderately calcareous from 35.73 to 36.47 m, strongly calcareous from 36.47 to base. Medium to large-scale cross-lamination. Large, horizontal burrows (0.005 m) at 39.53 to 40.15. Large, vertical burrow (0.17 m deep) from 39.62 to 39.80. Core rusty, broken, slickensided with calcite at 34.58 (75° CA), 35.04 (75° CA), 35.31 (65° CA), 35.80 (75° CA), 40.96 (50° CA), 44.95 to 45.16 (0° to 40° CA). Calcite-filled slickensided fractures at 44.95 (80° CA). Gradational.
	50.12	4.74	SANDSTONE- fine-grained, medium grey, clean, well-sorted, dominantly cherty, (70%; 30% quartz). Strongly calcareous throughout. Low-angle cross-lamination. Few mudstone laminae near top and base. Large, muddy intraclast at 49.10 m. Coaly lens (.004 m) at 49.92 m. Calcite filled fractures with slickensides at 45.45 (85° CA), 45.53 (85° CA), 45.61 (85° CA), 45.63 (75° CA), 45.86 (90° CA), 46.95 (90° CA), 47.23 (75° CA), 47.55 (80° CA), 47.40 (85° to 90° CA), 47.10 (25° CA).
	53.45	3.33	SANDSTONE, very fine-grained/MUDSTONE (65:35)-sandstone grading to siltstone, medium and small scale cross-laminated, light to medium grey, grading to dark grey mudstone. Slump structures, erosional contacts, bioturbated and churned zones, especially toward base. Between these zones of intense bioturbation, lamination is essentially undisturbed, except for small dark and large light burrows. Small load casts at base of some sandstone beds.

BH Nos. BP 42

Dip °	DEPTH m	THICKNESS m	DESCRIPTION
12 to 15	60.90	7.45	SANDSTONE - fine grained, light to medium grey, laminated, locally clean, dominantly cherty. Occassional mudstone laminae and bands, with large burrown; increasing frequency to base. Weakly calcareous. Slump structures at 57.36 m Rusty, rough joint at 54.00 (85° CA), 53.95 (75° CA), 55.54 (65° CA) and 55.74 (60° CA). Core broken and listricated, with calcite, 56.40 to 56.46. Core broken near parallel to core axis, 57.56 58.20, and 58.30 to 58.50.
15	63.65	2.75	SANDSTONE, fine grained/MUDSTONE dark grey (50:50) sandstone:light to medium grey, low-angle cross-laminated, dominantly clean, interbedded and laminated with mudstone. Patchily calcareous above 62.97 strongly calcareous from 62.97 to base. Dominantly sandy from 62.97 to base. Locally churned and bioturbated. Occasional large (to .005 m) sandy burrows in mudstone. Calcite joints at 61.53 (80° CA) and 61.75 (80° CA) Abrupt.
	64.50	0.85	SANDSTONE - fine-grained, medium grey, low-angle lamination and medium-scale cross-lamination 5% dark grey siltstone and mudstone. Calcareous. Lamination locally destroyed by intense burrowing. Burrows large (.003 to .005 m) and sandy. Abrupt.
12	83.44	18.94	SANDSTONE - very fine to fine-grained/ SILTSTONE/MUDSTONE (40:30:30) - sandstone and siltstone light to medium grey; mudstone dark grey. Lenticular, laminated, and interbedded. Locally small to medium-scale cross-lamination. Large, sandy burrows scattered throughout, also small, dark burrows. Intensely churned zones, where lamination has been completely obliterated. Pyrite band, .001 m at 74.97. Gradational. Sandstone moderately to strongly calcareous, mudstone non-calcareous.
	88.31	4.87	MUDSTONE/SILTSTONE/SANDSTONE - fine to very fine-grained (60:30:10) medium grey; where sandstone is present, light to medium grey. Most of the interval is highly churned and bioturbated, with abundant small dark burrows. Typical Sukunkoid lithology. Where bedding is preserved, low-angle cross-lamination.
8° at base			SANDSTONE - strongly calcareous, siltstone weakly calcareous, mudstone non-calcareous. Core broken at 83.90 to 84.17 (20° to 25° CA). Thin calcite veinlets at 86.22 (80° CA), 86.30 (80° CA), 86.32 (80° CA) 86.54 (80° CA), 86.57 (80° CA). Coarse calcite (.002 to .005 thick) at 87.34 and 87.39 (75° CA), 87.58 (70° CA) and 87.91 (80° CA).

BH Nos. BP 42

Dip o	DEPTH m	THICKNESS m	DESCRIPTION
			Thin, rusty calcite veinlet at 88.10 (83° CA). Broken at base.
	95.60	7.29	SANDSTONE - fine-grained/SILTSTONE/MUDSTONE (80:10:10)- dark grey. Medium-scale low-angle cross-laminated.
70 at	89.80		Abundant small, dark worm burrows. Core badly broken and ground out from 88.31 to 89.0.
90°	at 89.80		(Core loss in this interval 0.46 m.) Calcite
35°	at 90.10		veinlets and listrication. Core broken, listricated
35°	at 90.65		and contorted from 89.0 to 90.2, with dips to 90° and local overturning near 89.80. Near-vertical listrication
30°	at 91.60		from 89.50 to 90.00. Thin calcite veinlets. Core loss in
10°	at 93.70		this run 0.42 m. Breccia from 90.20 to 90.30. Thick, white calcite filling tension gash from 90.36 to 90.49. Joints, with well-developed slickensides and listric surfaces, closely spaced from 90.55 to 90.85 (65° CA). Rough, curved joint at 90.90 (27° CA). Listricated, slickensided joints with thin calcite (65° CA) at 90.95, 90.97, 91.07, 91.14, 91.31, 91.41, 91.53. Calcite-filled fractures parallel to core axis from 91.53 to 91.63. Core badly sheared and broken from 91.63 to 91.82; brecciated from 91.82 to 91.90. Core broken near parallel to core axis from 91.90 to 93.50. Core loss 0.12 m between 93.30 and 93.50. Recovered core is hard and strong; apparently ground out at top. Fault, possible at 90.70
	GATES		Dominantly mudstone with minor siltstone, from 92.35 to 93.73. Abrupt.
10	SUKUNKA 97.30	1.70	MUDSTONE/SILTSTONE/SANDSTONE, very fine-grained (30:30:40) - medium to dark grey, sporadically weakly calcareous. Load casts, rapidly alternating lithologies, laminated and interbedded. Few small dark burrows throughout; local concentrations of large (.003 m) sandy burrows. Locally churned. Fractures with slickensides and calcite at 96.31 to 96.33 (80° CA), 96.56 (70° CA); Curved, rough, rusty joint at 94.80 (30° CA) Gradational.
	107.51	10.21	MUDSTONE/SILTSTONE/SANDSTONE, very fine-grained (40:40:20) mudstone and siltstone, medium to dark grey, churned together and intensely bioturbated, interbedded with very fine-grained, medium grey, low-angle cross-laminated sandstone. Abundant small dark burrows. Channeling at base of sandstone beds. Patchily calcareous throughout. Fractures: 97.98 core ground out, .001 m band of strongly calcareous mud and granules of mudstone, possible fault gouge (80° CA); 105.32-105.37 core ground out, three bands of strongly calcareous, slightly rusty mud and granules of mudstone, within an interval of .005 m, also possible fault gouge (85° to 90° CA); 99.23 to 99.30 rough, rusty joint (20° CA). Core ground out at 99.97, but no

			sign of shearing; 100.45 slickensides and calcite (87° CA) 100.99, slickensides and calcite (85° CA); 100.31 to 100.45 rough, rusty fracture parallel to core axis; 103.42 to 103.50 core broken, with rough rusty joint (15° CA); 103.80 listricated, ground out, minor calcite (90° CA); 106.61 to 106.88 rough, rusty joint (10° CA). Gradational.
	122.28	14.77	MUDSTONE/SILTSTONE/SANDSTONE, very fine grained (60:35:5) - generally churned and bioturbated, with sandstone preserved as medium grey lenses (to .005 m thick), in a groundmass of dark grey silty mudstone. Local flaser structure with sandstone filling ripple troughs in siltstone and mudstone. Abundant small dark burrows. Weakly calcareous. Rough, rusty joint 110.03 to 110.16 (15° CA); 114.69 (87° CA), dark grey, strongly calcareous mud, with rock chips 115.73 to 115.92. 118.81 to 118.99 core broken and cracked with 1 cm bands of calcareous, soft, dark grey mud. CORE LOSS between 118.81 and 119.2: 0.21 m. Slickensides, calcite 119.24 (70° CA), rough, calcitic joint 121.09 to 121.38 (85 - 90° CA) Gradational.
3°	131.01	8.73	SANDSTONE, very fine-grained/SILTSTONE /MUDSTONE (40:40:20)- light to medium grey, dominantly churned and bioturbated, but well-preserved low-angle lamination in dominantly sandy beds to 0.27 m thick, with erosional bases. Abundant dark burrows. Local slumping and load casts. Large vertical burrows at top. Weakly calcareous throughout, locally strongly calcareous in well-bedded sandy units. Rough, calcite-filled joint 122.86 to 123.01 (0° CA); calcite-filled fractures at 122.87 and 122.91 (90° and 80° CA); rough, calcite- filled fractures at base of load-casted sand unit at 125.29 (75° - 90° CA); rough, calcite-filled joint at 125.37 to 125.50 (20° CA), slickensided calcite-filled fractures at 125.81 and 125.84 (87° and 85° CA). Rusty, curved calcitic joint at 126.01 to 126.23 (75° to 90° CA). Core broken, with rusty, calcitic joints at 127.01 to 127.28 (30° to 90° CA). Rusty, rough calcitic at 130.39 (33° CA). Rusty, rough, calcitic joint at 130.98 (85° - 90° CA). Gradational.
	157.73	26.72	MUDSTONE/SILTSTONE/SANDSTONE very fine-grained (40:40:20) —dominantly churned and bioturbated, medium to dark grey, with intervals to 0.20 m of laminated sandstone and siltstone, medium grey. Small-scale cross-lamination within laminated intervals; ubiquitous dark burrows throughout. Scattered large vertical burrows in interval 145.0 to 147.5.

BH Nos. BP 42

Dip °	DEPTH m	THICKNESS m	DESCRIPTION
			Sporadically weakly calcareous, except within laminated sandstone layers, which are locally very strongly calcareous. Rough, rusty joint at 131.80 (85° to 90° CA); calcite, rusty, slickensides at 132.22 (75° CA) and 132.29 (70° CA); rough, rusty at 132.55 (25° CA); and 132.78 (20° CA); rusty, silicified, coalified "wood chip" at 133.09; rusty, rough joints 134.30 (0° to 20° CA); rusty, rough joint at 134.49 (85° CA); 134.59 (70° CA); calcite stringers at 134.07; rusty, rough joint at 135.08 (38° CA); calcite and slickensides at 134.72 (75° CA); rough, rusty, joint at 136.10 (80° CA) and 136.25 (30° CA). Core broken parallel to core axis, rough and rusty 136.79 to 136.93. Calcite, slickensides at 138.51 (89° CA). Calcite at 141.35 (20° CA), core broken, calcite at 143.21 (35° CA);
3 at 150.00 /			Slickensides, finely crystalline calcite and euhedral, striated quartz crystals to .003 m long, at 149.30 (87° CA). Rough, rusty, calcitic at 150.19 (82° CA). Rough, calcitic at 151.29 (83° CA). Rough, rusty joints from 151.95 to 152.41 (0° to 20° CA). Dark calcitic filling at 156.61 (85° CA). Scoured at base, with 0.025 m medium to coarse-grained sand in a muddy matrix at immediate basal contact. Erosional. Two pelecypod valves at base.
	166.82	9.09	SANDSTONE - Fine to very fine-grained/silty mudstone (90:10) - medium grey; sandstone locally clean, but generally with mudstone laminae; where preserved, lamination is dominantly low-angle to parallel, with local slumping and small-scale cross-lamination. Locally bioturbated in top half, with vaguely preserved lamination and small, dark burrows. Extensive bioturbated intervals towards base, with abundant small and large dark burrows, and some large sandy burrows (Gates type from 163.11 to 163.17, abundant). Intraclastic bands at 162.11 and 162.91. Large sandy burrows from 157.73 to 157.92 both horizontal and vertical. Very strongly calcareous throughout.
			Rough, rusty joint at 158.67 (15° CA); rusty, listricated at 158.78 (80° CA); rough, rusty at 159.11 (22° CA); rusty and slickensided, calcitic, at 159.21 (70° CA); core broken, slickensided, with calcite, at 159.20 to 159.95. Probable core loss in this interval. Calcite, slickensided, at 160.08 (53° CA). Calcite stringers near parallel to core axis, at 160.44 to 160.60. Slickensides, calcite, parallel to lamination, at 160.81 (77° CA); calcite, rusty, some slickensides, at 161.26 (75° CA); 161.38 (85° CA); 161.45 (80° CA); 161.60 (73° CA); 161.76 (65° CA); core broken with abundant calcite veinlets and slickensides, from 162.21 to 162.46. Rough, rusty joint at 162.51 (23° CA). Calcite vein at

BH Nos: BP 42

Dip °	DEPTH m	THICKNESS m	DESCRIPTION
			163.44 (85° CA); rough rusty joint from 163.49 to 163.66 (10° to 20° CA). Calcite veinlets from 163.70 to 163.95 (60° to 80° CA), with ground rock chips, crumpled fragmental, rusty, very strongly calcareous, at 163.80. Possible fault gouge? Calcite, slickensided, at 163.72 (80° CA). Abrupt.
	205.62	38.80	MUDSTONE, silty/SANDSTONE, very fine-grained (80:20)— medium grey. Dominantly bioturbated and churned, with lenses of laminated sandstone to 0.16 m thick. Abundant dark burrows. Sandy units erosional at base; local small-scale cross-lamination, where bedding has not been destroyed by bioturbation. Pyrite band, strongly calcareous, estimated 85% finely crystalline pyrite, containing ? shelly fossil debris 0.0045 to 0.0075 m thick, at 145.54. Core rusty, broken, at 169.50 to 169.58, 0.0009 m thick coaly lens at 201.55, 169.50 to 169.58 calcite at 169.59 (80° CA) and 169.58 (75° CA); calcite and slickensides at 171.30 (90° CA); 176.55 (75° CA); 176.57 (90° CA), 176.81 (80° to 90° CA); rusty, calcite, slickensides at 179.13 (90° CA); rough, rusty joint at 179.72 to 179.77 (15° to 40° CA); rusty calcite at 180.08 (90° CA). NOTE: marker block "182.0" is in wrong place. Calcite at 179.93 (85° CA) and 180.02 (80° CA). Rusty, rough joint from 181.58 to 181.81 (0° to 25° CA).
5° at	192.46		Core broken with calcite, near parallel to CA, from 187.95 to 188.10 m. Rusty calcite at 188.88 (88° CA). Rusty, rough joint with calcite at 196.95 (35° CA). Calcite at 205.31 (80° CA). Gradational; strongly calcareous throughout.
	222.50	16.88	MUDSTONE, silty/SANDSTONE very fine-grained/SILTSTONE (90:5:5) - dominantly churned and intensely bioturbated, distroying all lamination except for lenses of sand near top, and silt near base. Overall fining-downward sequence. Small, dark burrows throughout. Bright, rusty coal, one stringer (probably detrital). Calcareous throughout from top to 216.96, sporadically calcareous to base. Basal contact is taken as the base of the last calcareous band. Rough, calcite joint 205.96 to 206.73 (15° CA). Rough, rusty calcite at 213.65 to 213.84 (5° CA). 0.012 m of brown mud inserted into corebox at 213.96, probably not part of recovered core, since core above and below fits together well. Rough, rusty calcite from 214.71 to 214.91 (8° CA). Rough, rusty calcite from 215.16 to 215.37 (5° CA). Core broken, rough, rusty, calcite from 216.11 to 216.55 (10° CA). Calcite at 216.60 (90° CA). Core rusty and broken, 216.72 to 216.80. Rough, rusty calcite from 218.98 to 219.12 (10° CA). Mud, brown, inserted as before, at 219.54. Calcite near parallel to

			CA, core broken from 220.67 to 221.12. Rough, calcite from 221.25 to 221.46 (10° CA). Rough, rusty from 221.79 to 221.89 (25° CA). Gradational at base.
	Sukunka		
	Moosebar		
	313.20	90.70	MUDSTONE - dark grey, homogeneously silty, non-calcareous. Network of calcite veinlets (near 90° CA) form 223.47 to 223.48. Rough, rusty calcite from 223.69 to 223.93 (18° CA), and from 224.39 to 224.74 (0° to 20° CA). Core broken and calcite at 231.26 (0° CA). Nodular band with calcite and pyrite at 236.0. Slickensides and calcite from 238.07 to 238.62. Ferruginous band at 241.39 to 241.43 (90° BCA). Calcite at 242.94 (70° CA). Slickensides and calcite at 243.18 and 243.28 to 243.49 (10° to 30°, and 65° CA). Core broken, with slickensides and calcite, (near (20° CA) at 246.0. Slickensides and calcite, 259.95 to 260.7 (45° CA). Slickensides at 260.97 (45° CA), and 261.21 (20° - 30° CA), and 261.28 (40° CA). Core badly broken, slickensides and calcite veining from 261.30 to 263.30. Within this 2.00 m interval, 0.70 m CORE LOSS. Fault,possible at 262.00 Slickensides and calcite from 265.53 to 265.70 (85° and 45° CA). Slickensides and calcite from 266.10 to 266.41, with core badly broken from 266.23 to 266.33. Slickensides at 0° to 90° CA. Slickensides at 267.28 (45° CA). Core broken and slickensides from 267.58 to 268.00 (90° to 45° CA), with calcite at 268.00. Overall, the interval from 259.95 to 268.00 is marked by a concentration of slickensides suggesting a fault of minor to moderate displacement. Core broken with calcite veining, at 270.06 to 270.19. Within the interval 271.90 to 272.30, only 0.12 m core recovered out of 0.40 m. The remainder has probably been ground out. Approximately 0.13 m of soft brown mud has been inserted at the middle of this interval. This non-calcareous substance is most likely drilling mud. Pyritised worm burrows and a few near-vertical calcite veins at 272.63. Core broken, with slickensides and calcite, 273.10 to 273.29. Slickensides and coarse calcite at 273.62 (40° CA). Calcite at 276.17 (65° CA). Calcite network at 279.52 to 279.62. Slickensides at 281.97 (50° CA). Calcite veinlets, partly open (40° to 60° CA) at 285.52. Slickensides and calcite at 287.23 to 287.32 (40° to 45° CA). Coarse calcite with open space at 288.20 (10° to 60° CA). Slickensides at 288.37 (40° CA). Coarse calcite with open space at 288.20 (10° to 60° CA). Slickensides at 288.37 (40° CA). Lenticular calcite veinlets at 288.62 to 288.66 (0° CA). Slickensides with calcite at 289.0 to 289.10 (35° to 55° CA), and 290.61 (55° CA). Small and large pyritized worm burrows, and pyrite blebs and specks, from 289.0 down to base.

Bh Nos. BP 42

Dip °	DEPTH m	THICKNESS m	DESCRIPTION	
			Ferruginous bands with clacite, at 290.82 to 290.89, 291.50 to 291.61, 291.70 to 291.77, 293.00 to 293.11 294.32 to 294.42, 295.47 to 295.60 (fragmental texture, probably effect of volume change due to recrystallisation) Bentonite from 295.27 to 295.43 (soft and crumbly, greasy texture) 300.58 to 300.60 (soft) 303.67 to 303.81 (hard), 306.88 to 306.90 (hard with small dark burrows, 308.63 to 308.64 (hard), 311.34 to 311.36 (hard, churned at top), 312.93 to 313.01 (waxy, hard), 313.19 to 313.20 (at base of Moosebar mudstone). Slickensides and calcite at 297.32 (55° CA), Core badly broken and slickensided at 298.85 to 299.00. Core broken and slickensided at 301.87 to 302.01, slickensided with clacite at 302.25 and 302.36 (60° and 60° CA). Core slickensided with calcite at 303.62 (55° CA) 304.14 (65° CA), 307.77 (80° CA). Abrupt.	
	313.80	0.60	SANDSTONE - fine to medium-grained, glauconitic, pyritic, dark grey-green, weakly calcareous. Few silica-rimmed, well-rounded chert pebbles. Burrowed; burrows are pyritised. One slickensided fracture at 60° CA. Basal contact churned, attached and abrupt.

Slickensides and calcite 0.91 below top (87° CA). DD 329.2 at base.
	330.48	1.59	SANDSTONE - fine to medium-grained, slightly coarser than above. Medium grey. Dominantly quartz (70%) chert (30%), clean, well sorted, strongly calcareous. Medium to large-scale low-angle cross-lamination. Medium burrows as above for 0.47 m below top, pyritised at 0.25 m below top. Slickensides and calcite at top (87° CA), at 0.31 m (89° CA). Carbonized and pyritsed wood chips at 0.79 m. DD 330.8 at base.
5° at	332.04 331.44	1.56	SANDSTONE - medium-grained. Medium grey, clean, well-sorted dominantly quartz (65% to 75%) chert (25% to 35%), strongly calcareous. Medium-scale low-angle cross-lamination, with some cross-sets up to 30° off bedding angle. Band of very fine-grained sand and mud, with calcite at 0.955 m below top (0.15 m thick; 85° CA). Coaly mudstone band at 1.06 m below top. DD 332.2 at base.
	333.59	1.55	SANDSTONE - medium to coarse grained from top to 0.70 m below top; fine to medium grained to 1.16 m below top; fine-grained to base. Overall fining-downwards sequence, but individual laminae are well-sorted, fining-upward. Medium grey. Overall about 70% quartz, 30% chert, proportions vary slightly between laminae. Very strongly calcareous. Large "Gates-type" burrows from 0.71 m to 0.76 m, and 1.14 m to 1.16 m below top. Thin band (0.003 m) of broken, carbonaceous, silty black mudstone with coal lenses, at 0.23 below top. DD 333.8 at base.
	335.18	1.59	SANDSTONE - fine-grained, medium grey. Clean, well-sorted overall about 75% quartz, 25% chert; strongly calcareous. Large-scale, low-angle to parallel lamination. DD 335.4 at base.
	336.74	1.56	SANDSTONE - as above. DD 337.0 at base.
	338.34	1.60	SANDSTONE - as above. Lamination partially obscured by burrowing: medium burrows (.003 m) from 0.17 to 0.46 m

BH Nos. BP 42

Dip °	DEPTH m	THICKNESS m	DESCRIPTION
			below top; large "Gates type" (.006 to .008 m) burrows with dark rims, from 1.04 to 1.12 m below top. Slickensides with calcite from 0.84 to 0.92 m below top (65° and 87° CA). DD 338.4 at base.
3° at	339.90 339.00	1.56	SANDSTONE - as above. Dark muddy laminae from 0.65 to 0.69 m below top, with calcite stringers. Large, "Gates type" burrows, some with dark rims, from 0.46 to 0.65 m below top. Lamination churned in this interval. Strongly calcareous throughout, as before. DD 339.9 at base.
	341.49	1.59	SANDSTONE - as above, with dark argillaceous laminae towards base. Churned and bioturbated from 0.60 m to base; medium and large "Gates type" burrows from 0.60 m to 1.19 m. Large vertical burrows from 0.96 to 1.28 m; all with dark rims. Strongly calcareous, throughout. DD 341.5 at base.
	343.08	1.59	SANDSTONE - as above, medium to dark grey, with argillaeous laminae from top to 0.77 m below top. Churned and burrowed from top to 0.93 m below top. Calcite stringers parallel to lamination at 0.32 m (76° CA). Slickensides and calcite at 0.68 m below top (52° CA). DD 343.0 at base.
	344.31	1.23	SANDSTONE - fine-grained, locally very fine-grained near base. Medium to dark grey. Vaguely laminated, probably bioturbated, but no visible vurrows. Quartz 60%, chert 35%, strongly calcareous. Clear and well-sorted. Coarsely crystalline calcite lens (0.003 m thick) 0.95 m below top, possible thick-shelled pelecypod fragment. Small shell fragment 1.01 m below top. Basal contact shows load structure.
	334.61	0.30	SANDSTONE - very fine-grained/MUDSTONE 50:50 - lenticles of sandstone and mudstone together, with thin, bright coal lenses, commonly rimmed with very thin stringers of calcite. Local small, dark burrows and slump structures. Coal commonly listricated. Grade beds (.01 m), at base, of sandstone, siltstone, and mudstone, fining upwards. DD 334.8 at base.
	345.01	0.40	MUDSTONE/SANDSTONE - as above, but individual graded units well preserved. Basal contacts of sand over bud are erosional. Sandstone: very fine-grained, medium grey, low-angle cross-laminated; Mudstone: dark grey few pyritised worm burrows. Gradational at base by interbedding.
	345.58	0.57	SANDSTONE - very fine-grained, medium to dark grey, low-angle large scale cross-lamination. Strongly calcareous. Abrupt.
	345.91	0.33	MUDSTONE/SANDSTONE (40:60) - as above, with a few medium sized vertical burrows. Strongly calcareous. DD 346.3 at base.
	347.5	1.59	MUDSTONE/SILTSTONE/SANDSTONE (50:30:20) - as above, but with

			local concentrations of large and small burrows. Strongly calcareous. DD 347.6 at base. NOTE: core breaks easily within this unit.
	347.55	0.05	MUDSTONE/SILTSTONE/SANDSTONE - as above, core ground.
	348.77	1.22	SANDSTONE - fine to very fine-grained, medium grey. Clean well-sorted, low-angle, large-scale cross-lamination overall except from top to 0.23 m, where fine to medium grained, with small-scale, low cross-lamination at top, and near-parallel lamination to base of interval 50% mudstone as lenticles from 0.23 to 0.42 m below top. Strongly calcareous throughout. Calcite (60 to 90° CA) at 0.07 to 0.09 m; 0.68 to 0.70 (70° CA, slickensided) and 0.93 (82% CA; coarsely crystalline). A few muddy lenses in basal 0.25 m.
	349.02	0.25	SANDSTONE - as above, a few muddy lenses. DD 349.4 at base.
	349.09	0.07	MUDSTONE - dark grey, few silty stringers, flecks of pyrite.
	349.81	0.72	SANDSTONE - fine to very fine-grained, large-scale low-angle corss-lamination or parallel lamination. Mudstone lenticles in top 0.02 m. Strongly calcareous. Coarsely crystalline calcite at 0.37 m below top. 0.05 m mudstone at base; muddy intraclasts scattered from 0.05 to 0.12 m above base.
	350.02	0.21	MUDSTONE/SILTSTONE/SANDSTONE, very fine-grained (30:60:10)l interlaminated, with small-scale cross-lamination. Core ground at base, strongly calcareous. DD 350.4 at base.
	350.15	0.13	MUDSTONE - dark grey; 5% silty stringers. Strongly calcareous.
	350.53	0.38	SANDSTONE - very fine-grained, medium grey, medium-scale low-angle cross-lamination. Strongly calcareous. Argillaceous laminae in lower 0.27 m.
	350.95	0.42	SANDSTONE - as above, with small, dark burrows and muddy intraclasts, 0.11 to 0.14 and 0.29 to 0.31 m below top.
	351.60	0.65	MUDSTONE - dark grey, 5% silty stringers. Strongly calcareous. Large, pyritized burrow at base.
0° at	352.18 351.83	0.58	SANDSTONE - fine to very-fine grained, medium grey, low-angle cross-lamination. Calcareous throughout. DD 352.4 at base.
	352.36	0.18	SANDSTONE - fine to very fine-grained, medium grey low-angle cross-lamination. Calcareous. Core ground at three points.
	353.77	1.41	SANDSTONE - fine to medium-grained, medium grey, low-angle cross-lamination. Calcareous. Lares "Gates-type" burrows 0.40 m below top.

BH Nos. BP 42

Dip °	DEPTH m	THICKNESS m	DESCRIPTION
	353.79	0.02	MUDSTONE - dark grey. Calcite and slickensides (90° CA) at base. DD 353.9 at base. NOTE: Core between 348.77 and 353.79 was reconstructed from scrambled core, boxes 123 and 124.
	354.51	0.72	SANDSTONE, fine-grained/SILTSTONE (95:5 at top, 90:10 at base) - sandstone: medium grey, quartx dominant over chert, interlaminated with dark grey siltstone on bedding surfaces. Lamination well preserved throughout, medium-scale, low-angle. A few flecks of mica on bedding surfaces. Calcite on bedding surface (86° CA) at 0.64 below top. Calcareous throughout.
	354.78	0.27	SANDSTONE/SILTSTONE - as above, with 15% siltstone at base A large intraclast of dark grey siltstone and mudstone, with swirled lamination, from 0.04 m to 0.08 m below top. Slickensides and calcite at 0.10 m below top (75° CA). DD 355.2 at base.
	354.815	0.035	SANDSTONE/SILTSTONE (85:15 as above, Core broken.
	354.86	0.045	SANDSTONE/SILTSTONE (95:5) - as above. One coaly inclusion at base. Core broken at base, with slickensides (45° CA).
	354.91	0.05	SANDSTONE - fine-grained, as above, less than 5% silty laminae. Erosional at base.
	355.02	0.11	MUDSTONE - carbonaceous - dark grey to balck few thin bright coaly inclusions. Marker: Pelecypod shells. Sampled for paleontological investigation: specimen BP 42/F1 Gradational at base.
	355.34	0.32	SANDSTONE, fine-grained/SILTSTONE (95:5) - medium grey sandstone with laminae of dark grey siltstone. Small- to-medium scale cross-lamination. 50% mudstone, carbonaceous, dark grey from 0.06 to 0.12 m below top. with sandstone lenses similar to flaser structures, and pyrite specks and poorly preserved pelecypod. Pyrite band (0.002 m) 0.16 m below top. Listricated at 0.07 and 0.08 m below top (80° to 90° CA), vaguely slickensided at 0.25 m below top (80° CA). Gradational at base.
	355.44	0.10	MUDSTONE - carbonaceous, dark grey to black, thin silty laminae. Core badly broken. A few coaly fragments in core box. Poorly preserved pelecypod fossils.
	355.48	0.04	MUDSTONE - as above, erosional at base. Calcite stringers parallel to erosional contact (45° CA), with slickensides. Pelecypod fossils sampled for identification. Specimen no. BP 42/F2

BH Nos BP 42

Dip o	DEPTH m	THICKNESS m	DESCRIPTION
4°	355.85	0.37	SANDSTONE, fine-grained/SILTSTONE (90:10) - sandstone, medium grey, with laminae of dark grey siltstone. Lamination mostly parallel, locally convoluted and low-angle cross-laminated. Small sandy burrows at base. Strongly calcareous throughout with irregular fragments of brown-stained calcite at top. Gradational at base.
	356.14	0.29	MUDSTONE/SILTSTONE (50:50) - dark grey, interlaminated, with specks of pyrite. Non-calcareous; carbonaceous at base, a few stringers of fine to very-fine grained sandstone, appearing to have been injected along bedding in the mudstone. Rusty; shelly fossils, fragmented, at base.
	356.26	0.12	MUDSTONE - carbonaceous, dark grey to black with bright coal lenses to 0.005 m, and blebs of siltstone.
	357.22	0.96	MUDSTONE - carbonaceous , with broken fragments of coal 0.05 m below top, and thin (0.001 m) bright coal bands from 0.05 to 0.09 m below top. Core ground, locally badly broken and pulverised. CORE LOSS 0.09 m.
	358.07	0.85	MUDSTONE - dark grey to black. Plant fragments, locally sheared at top
	358.92	0.85	MUDSTONE - dark grey to black. Carbonaceous at top, silty at base. Gradational.
	359.60	0.68	SILTSTONE - dark grey. Gradational downwards from siltstone/mudstone (50:50) at top, to siltstone/sandstone, very fine-grained (50:50) at base. Small and medium-scale cross-laminsyion throughout. DD 360.1 at base.
	359.96	0.36	SANDSTONE, very fine-grained/SILTSTONE (80:20) - medium grey, small to medium scale cross-laminated. Sandstone strongly calcareous, siltstone moderately calcareous.
	360.30	0.34	SILTSTONE - dark grey, coaly lenses to 0.002 m thick. CORE LOSS 0.25 m.
	360.57	0.27	SILTSTONE - dark grey, coaly lenses. Grading downward to siltstone/sandstone, very fine-grained (20:80); medium scale low-angle cross-lamination, partially destroyed by bioturbation. Muddy intraclasts. One large vertical burrow. Calcareous. Erosional at base.
	360.62	0.05	MUDSTONE?SILTSTONE (70:30) dark grey; siltstone as lenses in mudstone. Weakly calcareous.
	360.89	0.27	SANDSTONE, very fine-grained/SILTSTONE (80:20) - medium grey. High-angle, large-scale cross-lamination. Thin coaly lens near base. Calcareous throughout.
	360.93	0.04	MUDSTONE/SILTSTONE (50:50) - dark grey, siltstone as laminae and lenses. Calcareous.

BH No. BP 42

Dip °	DEPTH m	THICKNESS m	DESCRIPTION
	360.98	0.05	MUDSTONE/SILTSTONE - as above. Core slightly ground at top with calcite (79° CA). DD 361.7 at base.
	361.0	0.03	SANDSTONE/SILTSTONE (80:20) - sandstone very fine-grained medium grey. Siltstone dark grey. Core badly ground
	361.09	0.08	MUDSTONE - dark grey, silty. Core badly ground. Probable overdrill.
	361.20	0.11	SILTSTONE/MUDSTONE (50:50) - dark grey. Siltstone with argilaceous laminae at top. Mudstone with silty laminae at base. Core shows polishing and drillmarks on upper surface. Siltstone calcareous; mudstone non-calcareous.
	361.40	0.20	MUDSTONE, carbonaceous/COAL - broken fragments in core bos. Recovery: 0.04 m. CORE LOSS 0.16 m.
	362.87	1.47	SANDSTONE, very fine-grained/SILTSTONE (75:25) - interlaminated medium grey sandstone and dark grey siltstone, with predominantly muddy intervals from top to 0.20 m below top, 0.53 to 0.76, and 0.90 to 0.95 m below top. Carbonaceous clasts with calcite rims, from 0.77 m to 0.82 m below top. Calcite veinlets at top, (85° to 90° CA). Carbonaceous, with plant fragments, in upper 0.20 m. Core ground at 0.20, 0.26 0.36, 0.49 (Core lost?) and 0.62 m below top. Slickensides at 0.81 m (40° CA), 0.94 m (85° CA) and 1.13 m (57° CA) below top. Siltstone and sandstone moderately calcareous. Mudstone non-calcareous. DD 363.1 at base.
	364.37	1.50	SANDSTONE/SILTATONE - as above. 50% mudstone from 0.15 into 0.52 m below top with parallel and locally convolute lamination. Clean, very-fine-grained sandstone with small-scale cross lamination from 0.53 m to 0.64 m and 0.66 m to 0.72 m below top. Mudstone band from 0.64 to 0.66 m below top. Clean sandstone from 1.09 m to 1.37 m below top; Mudstone bands from 1.06 to 1.09 m and 1.37 m to base. Core ground at 0.11 m. Slickensides with calcite from 0.26 m to 0.32 m (35° CA) and 0.32 m to 0.37 m (35° CA) with accessory calcite veining at 90° to core axis. Slickensides and calcite at 0.65 m (85° CA, vague) and 0.78 m (85° CA). Bedding crumpled with calcite-rimmed carbonaceous inclusions from 0.82 to 0.83 m below top. Slickensides and calcite at 0.97 m (85° to 90° CA). Slickensides and calcite at base (90° CA). Unit strongly calcareous throughout. DD 364.6 at base.
0° to 5° at base	2° 365.86	1.49	SILTSTONE/MUDSTONE (50:50) - thinly laminated, dark grey mudstone and medium grey siltstone. Dominantly parallel-laminated; some small-scale cross-lamination in siltstone. Few thin sandy lenses in upper 0.20 m. Basal 0.03 m slightly carbonaceous, with slickensides and calcite (67° CA). Shedred, calcite-filmed coal at base. Core dished at 0.94 m but no core loss observed. Calcareous throughout. Sharp, unattached. Basal 0.03 m sampled BP 42/CHU/5

Carbonaceous, with coaly stringers at top, grading over a thickness of 0.01 m into the Chamberlain Seam proper. Quartz-chert, well-sorted, non-calcareous. Slickensided surface with coaly materal and calcite, 0.08 m below top (71° CA). Coaly band (0.001 m thick) 0.13 to 0.17 m below top (45° CA), may mark a scour surface. Gradational at base.	
	386.25	5.72	SANDSTONE - medium-grained, grading down to fine-grained at base. Medium to dark grey, estimated quartz 60%, chert 40%, distinctive "salt and pepper" appearance. Clean, well-sorted. Massive at top, large-scale cross-stratification at base. Coaly fragments at 1.02 m. 1.72 m and 1.75 m below top. Core slickensided with calcite at 2.38 m (50° CA), 2.44 m (75° CA), 2.49 m (70° CA) and 2.53 m (75° CA). Shaly intraclast at 2.74 m below top. Very fine-grained sandy and silty laminae comprise 5% of the interval from 3.20 to 3.49 m belowtop. Mudstone from 3.49 to 3.51 m, polished and slickensided at 85° CA. Slickensides and calcite at 3.55 m (80° CA), 3.62 m (87° CA) and 3.73 m below top (75° CA). Core broken from 4.70 to 4.87 (15° CA) with patchy calcite. Slickensides and calcite at 4.99 (70° CA) 5.07 (82° CA), 5.23 (70° CA), 5.30 (60° CA), 5.37 (57° CA) 5.42 (37° CA), 5.44 (60° CA), 5.56 (33° CA), 5.58 (40° CA) m below top. Core broken at low angle to core axis at base. Unit calcareous to 4.41 m belwo top; gradational to strongly calcareous at base.	
	386.25		BASE OF HOLE - DD 386.4 m

---oooOooo---

Dip °	DEPTH m	THICKNESS m	DESCRIPTION
	6.65	6.65	OVERBURDEN- no core. Pebbles in core box.
			GATES
	16.47	9.82	SANDSTONE- fine to medium-grained; dominantly medium-grained from top to 9.2m; dominantly fine-grained from 15.10m to base. Medium grey, clean, well-sorted. Moderately to strongly calcareous throughout. Quartz 65-70%, chert 30-35%. Medium to large-scale low-angle cross-lamination. Small, thin (0.0002m) shaly intraclasts from 8.97m to 8.99m. Sporadic, faint, medium-sized (0.003m) worm burrows with faint dark rims, from 12.57m to 13.58m. Small (0.001m) faint burrows from 15.99m to 16.23m. Large (0.004m) faint, dark rimmed burrows from 16.18m to 16.33m Joints at 6.95m (75°CA; core rusty for 0.01 to 0.02m on either side), 7.08m (83°CA; core rusty for 0.005m on either side), 7.6m (88°CA; core rusty for 0.005m on either side), 7.85m (89°CA; core rusty for 0.005m above joint). Core broken, slightly rusty, from 8.20m to 8.24m. Joints at 9.25m and 9.26m (85°CA; core rusty between joints and for 0.005m above). Rusty joint at 10.41m (78°CA), and 11.41m (85° to 90°CA). Joint at 11.44m (45°CA), with dark grey stain parallel to joint, for 0.02m below joint, and faint parallel dark bands for 0.13m below joint. Core broken from 11.63m to 11.70m, (34°CA) with parallel dark bands as above. Core ground at 13.30, core loss on the order of a few centimetres at most. Joints at 13.80 (25°CA and 84°CA, core rusty for 0.005m below). Joints at 14.70m (35°CA), 14.79m (60°CA), 14.85m (65°CA), 14.96m (65°CA) 15.03m (55°CA). Rusty patches througout the interval, from 14.70m to 15.03m. Joint planes intersect at ~45° angle.
	16.59	0.12	MUDSTONE- dark grey, very badly broken and coated with a thick layer of drilling mud. Baked appearance, probably bit "burned in " at this point.
5°at	24.76 18.35m	8.17	SANDSTONE, fine-grained / MUDSTONE(50:50)- medium-grey sandstone, both as clean, well-sorted beds to 0.25m thick, and interbedded in various proportions (average 70% mudstone) with dark grey silty mudstone. Clean sandstone composed of 65% quartz, 35% chert; strongly calcareous, with medium-scale low-angle cross-lamination, local abundant shaly intraclasts, erosional with load casts at base. Interbedded sandstones less well-sorted, non-calcareous, commonly grading upward into silty mudstone, and erosional at base. Local small dark burrows in the mudstone; abundant large (0.004 to .005m) sandy burrows throughout the interbedded intervals. Abundant carbonised plant fragment and two thin coaly lenses in basal 0.04m. Abundant listri surfaces throughout on mudstone laminae and interbeds, generally parallel to lamination. Slickensides and minor calcite from 17.82m to 17.86m (75°CA). Slickensides and

Dip o	DEPTH m	THICKNESS m	DESCRIPTION
			calcite at 21.90m (75°CA). Core badly broken with rough, rusty slickensides and calcite at 22.69m. Abrupt at base.
	24.94	0.18	CONGLOMERATE- clasts of dark grey chert, black chert, greenish grey chert, white quartzite, all well rounded, many with weathering rinds, in a porous, non-calcareous fine sand matrix, with carbonaceous fragments at the top. Matrix is indistinguishable from the overlying sandstone, which is also non-calcareous. Clasts range from very coarse sand size to pebbles grater than 0.045m (core diameter). Sorting within this sunit is poor. As the base of the unit is represented by a single large clast completely occupying the core, the basal contact may or may not be erosional, but is abrupt.
			TOP OF GATES "B" SEAM
	24.98	0.04	COAL- dull, broken.
	26.12	1.14	MUDSTONE- dark grey, carbonaceous at top, becoming silty towards middle; sheared, broken, carbonaceous with coaly bands at base. Slump structure in upper 0.10m of unit. Bedding is churned throughout; few small (0.001m to 0.002m) burrows. Slickensides at 45°CA at 25.14m. Abundant shearing and slickensides from 25.45m to base (30° to 55° CA). Between 25.52m and 26.12m, 0.17m core recovered, badly broken, including a fragment of coal, bright banded (0.01m). CORE LOSS 0.43m.
			BASE OF GATES "B" SEAM
3°at	28.88 26.52m	2.76	SANDSTONE, fine to very fine-grained/SILTSTONE, argillaceous(50:50)- medium grey, interbedded and interlaminated. Small to medium-scale low-angle cross-lamination. Abundant plant fragments. Phases of dark grey, carbonaceous mudstone from 26.22m to 26.37m, 26.90m to 27.02m , and 28.12m to 28.28m. Sandstones only locally clean;generally silty or argillaceous. Unit non-calcareous at top; calcareous at base. Basal 0.37m dominantly clean sand. Abrupt.
			TOP OF GATES "A" SEAM
	29.37	0.49	MUDSTONE- dark grey, carbonaceous. Coal at base, recovered 0.04m of coal, dull and bright. Upper 0.13m of unit recovered fully, but 0.25m core loss at base of unit, probably above the coal.
			BASE OF GATES "A" SEAM
	41.75	12.38	CONGLOMERATE- well-rounded pebbles of white quartzite, light and dark grey chert, grey-green chert. No matrix

Dip °	DEPTH m	THICKNESS m	DESCRIPTION
			observed; clasts are well cemented by interstitial silica. Weathering rinds on many clast, and good rounding suggest second cycle origin. Rock very strong and hard; locally porous. Sorting generally good; clasts range from very coarse sand and granular to pebbles of 0.03m. Mean 0.005 to 0.006m. From 41.37m to base, increasing proportion of fine-grained sand until base is reached; taken as base of granules. Gradational.
3°at	52.76m 48.63	11.01	SANDSTONE- fine-grained, medium grey, clean, well-sorted. Quartz 65% chert 35%. Weakly calcareous at top, grading to strongly calcareous from 42.98m to base. Locally abundant carbonised plant fragments, from 41.85m to 42.60m. Granules at 42.67m; pebbles at 43.62m, 43.72m and 44.33m. Calcite at 46.74m (88°CA). Core rusty and broken at 46.99m (70°CA). Slickensides and calcite at 47.19m (82°CA). Core rusty and broken from 47.14m to 47.44m (0° to 15°CA). Calcite at 47.34m (85°CA) and 47.44m (coarsely crystalline 75°CA). Slickensides and clacite at 47.50m (88°CA), and 50.18 to 50.43m. Slickensides and clacite at 50.81m (88°CA). Rough, rusty fracture from 50.72 to 50,87m (0° to 70°CA). Calcite veinlet at 50.85m (18°CA), and 50.93m (90°CA). Calcite with slickensides (0.005m thick) at 50.94m (80°CA). Slickensides and calcite at 51.37m (70° CA), also rough, rusty fractures near parallel to core axis. Slickensides and calcite at 51.47m (88°CA). Core broken from 52.31m to 52.50m, with slickensided surfaces from 65° to 90°CA, with rough, rusty joint at 15°CA, and calcite at 28°CA. Silty laminae from 52.38m (50% of rock) to 52.59m (5% of rock.) Abrupt.
8°at	56.18 53.78	3.42	SANDSTONE, fine to very fine-grained/MUDSTONE(50:50)- Lenticular laminae and interbeds of dark grey silty mudstone and medium grey, low-angle cross-laminated sandstone. Sandstone with minor argillaceous laminae, from 53.02m to 53.12m , and 55.71m to 56.03m. Common erosional contacts at base of sandstones,with load casts into underlying mudstones. Mudstones generally as discrete layers, although some upwards gradation from sandstone to mudstone. Abundant intraclasts and wisps of sand and mud. A few small (0.001m) dark burrows, and medium (0.003m) sandy burrows. Local intense bioturbation. Slickensides and calcite from 53.14m to 53.22m (85°CA). Core polished, with clacite, at 54.78m (88°CA). Listricated and slickensided at base (82°CA). Sandstones strongly, mudstones weakly calcareous Abrupt.
	67.35	11.17	SANDSTONE- fine-grained, medium grey, with thin dark grey argillaceous laminae. Quartz 65%, chert 35%, sorting good but low porosity due to argillaceous content. Large-scale

Dip °	DEPTH m	THICKNESS m	DESCRIPTION
			low-angle cross-lamination. Weakly to moderately calcareous. Intensely bioturbated, burrowed sandstone/mudstone (50:50) at 59.00 to 59.17m, 59.46 to 59.33m, 60.10 to 60.28m,(with coaly stringers), 62.42 to 62.80m, 63.07 to 63.12m, 63.24 to 63.39m, 65.53 to 65.74m, 66.97 to 67.04m, and 67.10 to 67.29m. Slickensides and calcite at 56.36m (79°CA). Listric surfaces and calcite from 56.46 to 57.39m, at 30°, 50°, 80°CA range. Core broken with listric surfaces, slickensides and clacite from 57.31 to 58.38m. Core badly broken from 57.53 to 57.72m. Fault, possible. Slickensides and calcite at 58.63m (85°CA). Core badly broken, some shearing and calcite, from 59.75m to 59.00m Core ground, 58.99 to 59.25m. Slickensides and calcite at 59.17 (60°CA), 59.25 (78°CA), 59.37 (84°CA) 59.45 (68°CA) 59.52 (70°CA) 59.60 (87° CA). Core broken, rough and rusty from 59.45 to 59.60 (20°CA). Calcite at 61.44 (90°CA) and 61.49 (88°CA).
7°at	65.93		NOTE: DD Bocks 59, 60.1 and 62.4 are out of place, due to leaving core in hole on barrel pulls. Core broken with slickensides and calcite from 62.10 to 62.40m (80°CA). Slickensides and clacite at 63.55m (87°CA). Listric surfaces at 70° to 90° CA in sandstone/mudstone from 65.52 to 65.74m, and in mudd y parting at 65.93m. Slickensides in sandstone, possibly "baked"at 66.23m. (68°CA). Abrupt at base.
	67.43	0.08	CONGLOMERATE- subrounded to rounded pebbles and granules (0.002 to 0.008m) within 30% matrix of very fine to fine-grained sand. Clasts of dark and light grey chert, greenish grey chert, white quartzite and shell fragments. Sandstone lens at base. Calcareous throughout. Erosional
	68.13	0.70	MUDSTONE/SANDSTONE (50:50)- sandstone, very fine to fine-grained, medium grey, interbedded with mudstone, silty, dark grey. Bedding generally destroyed by intense bioturbation. Scattered large (0.004m) burrows. Coarse-grained, clean sandstone, strongly calcareous, from 67.53 to 67.66m. Elsewhere, weakly calcareous. Core broken parallel to core axis, from 67.55 to 68.40m (below base of interval.) Abrupt.
	70.96	2.83	SANDSTONE/MUDSTONE (80:20)- sandstone, fine-grained, mediu grey, quartz-chert, strongly calcareous, thin argillaceous laminae, ripple to large-sxale, low-angle cross-laminated, interbedded with mudstone, very silty, dark grey. Extensive bioturbation towards base; sporadic large (0.004m) burrows and small shaly intraclasts. Sandstones erosional and load-casted at base. Abrupt.
	82.26	11.30	SANDSTONE, fine to very fine-grained/ SILTSTONE/MUDSTONE

Dip o	DEPTH m	THICKNESS m	DESCRIPTION
4°at	76.22		(40:30:30)- rapidly alternating lenses and interbeds of medium grey sandstone and dark grey siltstone and mudstone. Sandstones erosional at base, grading upward to siltstone and mudstone. Locally intense bioturbation; large (0.004 to 0.005m) and small, dark (0.001m) burrows. Strongly calcareous throughout, with local very strongly calcareous, clean, fine to medium-grained sandstone, with probably abundant detrital carbonate. Core broken parallel to core axis 70.96 - 71.47, 73.06 - 73.24. Calcite and slickensides 79.34 (70°CA). Core broken parallel to axis 80.33 to 80.50. Listicated coaly parting 80.85. Calcite and slickensides 80.97 (62°CA). Core broken, rough and rusty 81.40 - 81.70 (10°CA), 81.89 - 82.13.
GATES			
SUKUNKA			
	87.17	4.91	SANDSTONE, fine to very fine-grained/SILTSTONE (80:20)- interbedded, medium grey small cross-laminated sands, grading upwards into medium grey silts. Sands erosional and load casted at base. Abundant medium and large burrows (.003 - .005), small dark burrows (less that 0.001), and large pelecypod burrows (.025). Generally bioturbated, commonly slumped. Sheared coaly lenses 84.40 - 84.45. Slickensides, and calcite 84.54 (80°CA), slickensides and coarsely crystalline rusty calcite 84.82 (47°CA), 84.84 (83°CA); calcite 84.88 (85°CA); slickensides 85.75 (87°CA), slickensides at 86.08 (88°CA).
6°at	86.31		
	98.28	11.11	SANDSTONE, very fine-grained/SILTSTONE(60:40)- light to medium grey sandstone with silty laminae, interbedded with dark grey siltstone. Medium-scale low-angle cross-lamination where preserved; unit generally intensively bioturbated. Weakly calcareous throughout; locally moderately calcareous in unchurned sandstones. Ubiquitous small dark (0.001m) burrows; sporadic large (0.004m) sandy burrows. Slickensides and calcite at 95.56m (68°CA) and 96.07m (80°CA), 97.83m (52°CA). Gradational.
3°at	96.45m		
0°at	102.68m		SILTSTONE, argillaceous/SANDSTONE, very fine-grained (95:5)-
	103.72	5.44	dark grey, extensively bioturbated siltstone with lenses of ripple-laminated sandstone. Abundant small, dark burrows Sporadic medium (0.003m) worm burrows, both horizontal and vertical, and large (0.015 to 0.020m0 pelecypod burrows. Weakly calcareous throughout. Slickensides at 98.30m (90°CA). Core broken near core axis (10°CA) from 99.11 to 99.50m and parallel to core axis from 100.01 to 100.28. Core broken, rough, slightly rusty, from 100.84 to 100.93 (22°CA), and 101.06 to 101.15m (23°CA), and 101.35 to 102.10m (0° to 25°CA). Core badly broken 101.70 to 101.96 -does not appear to be structural origin, but rather due

BH Nos. BP47

Dip °	DEPTH m	THICKNESS m	DESCRIPTION
			to hammering. Gradational.
	112.74	9.02	MUDSTONE, silty/SILTSTONE, (95:5)- Intensively bioturbated dark grey mudstone, with scattered lenses of medium grey siltstone. Vague low-angle lamination. Ubiquitous small, dark burrows, and serrated burrows. Siltstone lenses generally burrowed and partially obscurred, with some large (0.004m) light, silty burrows. Sporadically, weakly calcareous. Core broken near parallel to core axis from 103.72 to 103.98m, trace of rusty calcite (0° to 20°CA). Trace of calcite at 104.52m (40°CA). Core broken from 105.45 to 105.60m, with joint at 10°CA. Core ground at 105.60m. Core broken but no calcite, from 106.10 to 106.40m. Core broken parallel to core axis from 108.29 to 108.97m. Mud, very light grey, poorly indurated, from 109.01 to 109.39. Interbedded with normal silty mudstone, slumped together, appears reworked. Composition:- 20% calcite (secondary, as veinlets and impregnation); 10% biotite, as brown hexagonal plates; 70% clay. Probable reworked tuff. Fractures, filled with calcite at 109.09 (20°CA). Core broken near parallel to core axis, from 109.39 to 101.96.
	122.03	9.29	SILTSTONE/SANDSTONE, very fine-grained (95:5)- medium to dark grey, intensively bioturbated, with vague remnant lamination and local sandstone lenses toward base. Abundant small dark burrows from top to 116.0m; local concentrations of burrows from 116.0 to base. A few serrated dark burrows. Large, vertical pelecypod burrows at 121.20. Strongly calcareous throughout very fine-grained sandstone bed from 116.10 to 116.42. Weakly calcareous throughout rest of unit. Rough joint with calcite at 116.19m (50°CA), and 116.37m (80°CA). Some calcite at 120.97 (90°CA). 121.07 (88°CA), 121.10m (85°CA). 20% sandstone in basal 1.0 meter; gradational.
1°at	148.27 128.61m	26.24	SILTSTONE/MUDSTONE/SANDSTONE, VERY FINE-GRAINED (70:25:5)- intensely bioturbated, weakly calcareous, siltstone and mudstone (indistinguishably churned together) with thin interbeds of sandstone, also bioturbated, but recognisable. Ubiquitous small dark burrows, and abundant medium (0.003 to 0.005m) sandy, light burrows. A few large vertical pelecypod burrows near base. Undisturbed sandstone bed from 141.33 to 141.35m shows ripple cross-lamination. Calcite at 126.71m (90°CA). Core broken parallel to core axis from 127.32 to 127.44m, with calcite and minor pyrite. Poorly preserved pelecypod valve at 129.56m; specimen BP47/F1. Core broken at 20°CA, rough, no mineralization, from 130.36 to 130.50m and 130. 47 to 130.56m (parallel fractures). Calcite at 135.19m (83°CA). ?shell fragments at 135.31 and 135.22m;

BH Nos - BP47

Dip °	DEPTH m	THICKNESS m	DESCRIPTION
			0.009 to 0.030m long, 0.0007m thick, with a columnar structure reiniscent of that in Inoceramus. Calcite at 135.33m (85°CA). Calcite at 135.50m (90°CA), adjacent to pyritic nodule in siltstone. Rough joints 136.56 to 136.87 m (5°CA), and 138.16 to 138.48m (0° to 10°CA). Pelecypods at 139.78 and 139.93 (specimens, BP47/F2 and BP47/F3). Cephalopods at 138.62m (poorly preserved: BP47/F4). Rough fracture parallel to core axis, from 142.32 to 142.62. Calcite at 143.30m (81°CA), and 143.81m (80°CA). Pelecypod at 143.97m (BP47/F5). Rough fracture from 147.62 to 147.79m (10°CA). Gradational.
	153.31	5.04	SANDSTONE, fine to very fine-grained/SILTSTONE/MUDSTONE (80:15:5)- medium grey sandstone with silty laminae, interbedded with bioturbated, churned dark grey siltstone
1°at	148.52		and mudstone. Low-angle medium-scale cross-lamination and large (0.005m) dark-rimmed, sandy "Gates-type" burrows in sandstone. Mica flecks. Small dark burrows in siltstone and mudstone. Sandstones erosional, load-casted at base, sometimes bioturbated at top below siltstone beds. Strongly calcareous throughout. Calcite at 148.69m (88°CA). Gradational.
	158.40	5.09	MUDSTONE, SILTY/SANDSTONE, very fine-grained(75:25)- dark grey silty mudstone, intensely bioturbated, with interbeds and laminae of medium grey sandstone. Some low-angle and ripple lamination in sandstones. Small dark burrows in mudstones; sandstones are not burrowed except at top : occasional pelecypod burrows. Strongly calcareous throughout. Calcite at 153.81m (90°CA). Rough fracture with calcite (5° to 30°CA) from 154.73 to 154.82m. Fractures at 0° to 30°CA, but unmineralised, from 155.22 to 156.02m, and 157.27 to 157.84m. Gradational.
	195.38	36.98	MUDSTONE/SILTSTONE/SANDSTONE, very fine-grained (75:20:5)- dark grey, bioturbated siltstone and mudstone, intimately churned together, with lenses of medium grey siltstone and sandstone, and interbeds of sandstone to 0.18m thick. Bioturbation is generally so complete that burrows are difficult to recognise, but abundant dark burrows are evident
4°at	159.96		where the degree of churning is not as high. A few pelecypod burrows. Sandstones generally with silty laminae;
6°at	176.66		dominantly low-angle, medium-scale cross-lamination, with
6°at	196.08		some ripple lamination. Strongly calcareous throughout. Rough fracture from 159.16 to 159.30m (18°CA). Calcite at 166.34m (35°CA). Rough fracture from 171.83 to 171.90m (30°CA). Rough fracture with patchy calcite at 172.45m (86°CA). Slickensides and calcite at 173.67m (78°CA). Calcite at 176.50m (87°CA). Rough, slightly rusty fracture at 177.85 to 177.91m (35°CA). Rough fractures from 180.62 to 180.88m (82°CA) and 181.69 to 181.89m (79°CA).

BH Nos. BP47

Dip °	DEPTH m	THICKNESS m	DESCRIPTION
			Rough, slightly rusty fractures from 182.23 to 182.36m (18°CA), and 180.69 to 180.74m (42°CA). Core broken from 0° to 20° CA, patchily rusty and calcareous, from 185.59 to 185.98m, and from 186.60 to 187.07m. Core broken near parallel to core axis, from 194.65 to 194.83m.
	201.92	6.54	MUDSTONE/SILTSTONE/SANDSTONE, very fine-grained (85:10: 5)- dark grey, intensely bioturbated mudstone and siltstone, indistinguishably churned at top and abrupt at base. Small-scale, low-angle cross-lamination is preserved in the sandstones; siltstones and mudstones are only vaguely banded. Scattered small dark burrows. ? Shell fragments similar to those observed at 135.21 and 135.22m, at 200.31 m. Specimen BP47/F6. Core broken 198.36 to 198.54 (10° and 25°CA), 198.90 to 191.52m (0° to 20°CA), and 201.39 to 201.48m (0°CA). Unit strongly calcareous throughout; gradational base.
3°at	200.52		
	216.14	14.22	MUDSTONE/SILTSTONE (90:10 to 98:2) at base.- dark grey mudstone and siltstone, intensely bioturbated and churned together. Vague banding of lighter silt-rich layers and darker muddy layers. Basal contact taken at base of last calcareous band. Unit strongly calcareous at top, grading to sporadically calcareous at base. Slickensides and calcite at 203.69m (89°CA). Core broken with clacite along rough surface from 203.84 to 204.07 (5° to 15°CA), and core broken from 204.12 to 204.26m (18°CA) and from 204.82 to 204.90m (0° to 5° CA). Core broken near paralle to core axis, from 206.83 to 207.23m. Slickensides and calcite at 201.49m (90°CA). Gradational at base.
SUKUNKA			
MOOSEBAR			
	292.27	76.13	MUDSTONE- dark grey, homogeneously slightly silty. Common pyritized worm burrows from 250m to base. Non-calcareous throughout. Core broken, rough, unmineralised, from 216.75 to 216.84m (48°CA; three parallel fractures). Core ground at 218.6; no loss indicated. Core broken at 5° to 14°CA from 221.96 to 222.18m, and at 0°CA from 222.32 to 222.62m. Calcite veinlet from 223.37 to 223.44m (14°CA). Smooth fracutre from 224,28 to 224.34m (30°CA); rough fracture from 224.52 to 224.58m (35°CA), and 225.49 to 225.56m (28°CA). Patchy calcite from 228.07 to 228.13m (40°CA). Slickensides and coarse calcite at 229.18m (83° CA); slickensides and clacite from 230.80 to 231.07m (5° CA); core broken at 2° to 7° CA from 231.10 to 231.40m. Unidentifiable shell fragments at 232.69 and possible pygitised gastropod (poorly preserved). Core broken (0° to 20°CA) from 233.90 to 234.40m. Core broken (60° to 70°CA) from 234.83 to 234.94m, from 235.14 to 235.35m (40° to 60° CA), and from 235.62 to 235.80m (45°CA). Core broken at 237.55m (67°CA). Slickensides at 237.84m

BH Nos. BP47

Dip °	DEPTH m	THICKNESS m	DESCRIPTION
			(87°CA); core broken at 75° to 90°CA. Slickensides and calcite at 78°CA at 238.90m. Slightly grooved fractures at 240.29m (75°CA) and 240.37m (72°CA). Fracture at 240.37 to 240.44m (20°CA). Rough fractures with gauge bands from 240.62 to 240.69m., (25° and 75°CA). Abundant rough fractures from 240.60 to 241.20m (40° to 45°CA). Core broken with slickensides and calcite from 243.35 to 243.55m (0° to 35°CA). Slickensides and calcite at 244.16 (80° to 85° CA). Core broken from 244.53 to 244.63m (65° ti 70°CA), and from 244.78 to 245.27m (probably due to hammering of core). Slickensides, quartz and calcite at 245.49 and 245.56m (68°CA). Core listricated, with calcite at 246..20m (67°CA). Slickensides and calcite at 246.07m (81°CA), at 246.40m (55°CA), 246.70m (80°CA), 246.81m (80°), 246.83m (50°), 246.90m (60°). Calcite from 246.70 to 246.81m (10°CA). Slickensides and calcite at 247.01m (40° and 68°CA) and 247.03m (77°CA). Listric surface at 247.16m (88°CA). Ferruginous band from 250.46m to 250.50m. Rough slickensides at 252.34m(88°CA). ?shell fragments from 252.50 to 252.52m, similar to those at 135.21 and 200.31m. Listric surface (82°CA) at 254.98m. Core broken at 0° to 5°CA, from 254.98 to 255.20m. Listric surfaces from 255.37 to 255.56m
2° at	250.46		(50° to 80°CA). Core broken parallel to core axis from 255.85 to 256.19. Smooth fractures across core from 255.85 to 259.43m; 0.05 to 0.20m apart, at 45° to 70°CA. Calcite at 45°, 58° and 90°CA, at 258.36m. Slickensides and calcite at 261.22 and 261.26m (55° and 60°CA). Core broken parallel to core axis, from 261.30 to 261.46m; 263.20 to 263.35m, and 263.91 to 264.07m. Slickensides and calcite at 263.75m (52°CA), 265.33m (20°CA), 265.36m (80° CA), 265.39m (80°CA), 265.58m (62°CA), 266.00m (46°CA), 266.17m (88°CA). Core internally sheared and listricated at 267.37m. Calcite veinlets at 80° to 85°CA, from 267.42 to 267.44m. Ferruginous band from 269.16 to 269.29m; modular structure with calcite veining. Slickensides and calcite at 272.91m (38°CA). Core sheared and broken (45° to 60°CA) from 273.30 to 273.42m. Slickensides at 52°, at 273.56m. Ferruginous band with nodular structure and calcite veining as above, from 273.62 to 273.70m. Listrication and coarse calcite at base. Slickensides and calcite at 273..85m (72° CA). Bentonite band: hard, sheared, with dark worm burrows, from 274.77 to 274.87m. Calcite at 276.78m (68°CA) and277.17m (80°CA). Slickensides
6° at	284.64		at 277.02m (38°CA). Bentonite, hard, greasy lusture and surface, soft and sheared in top 0.05m; from 280.03 to 280.22m. Calcite at 282.88m (68°CA). Ferruginous bands, with burrows, from 283.32 to 283.47m and 284.88 to 284.96m. Lens of fine-grained, medium grey sandstone at 284.63 to 284.64m. Slcikensides at 285.48m (32°CA). Pyritic bands from 285.69 to 285.91m. Slickensides at 287.80 and 287.85

BH Nos. BP47

Dip °	DEPTH m	THICKNESS m	DESCRIPTION
			(88°CA). Bentonite from 288.45 to 288.47 (hard, bioturbated, 50% dark mudstone churned in); 291.13m (0.005m churned stringer; hard), from 291.52m to 291.62m (estimated 10% of inerval is bentonite as wisps and burrow-fillings); 292.16 to 292.23m (10% of interval ; churned, hard and sheared at base); 292.57m to 292.66n: 0.04m at top churned and burrowed, hard with greasy surface; underlain by 0.01m soft and muddy; basal 0.04m is hard and fragmented. Abrupt basal contact with normal dark grey mudstone. Base of Moosebar mudstone is marked by 0.03m bentonite band, from 292.82 to 292.85m: hard, greasy, with large worm burrows filled with dark grey-green, glauconitic mudstone. Abrupt base.
			SANDSTONE- dark green, glauconitic, pyritic. Muddy matrix, floating medium-grained sand and chert granules. Matrix increases to top (10% to 60%). Interpreted as basal transgressive facies of the Moosebar. Erosional. Slickensides and calcite from 293.07 to 293.33. (45°, 62°, 75°CA). Basal 0.11 sampled. Erosional base, dip 0° to 50°.

	294.72	0.18	SEAT EARTH MUDSTONE- dark grey and carbonaceous with abundant coaly and listric roots.
	295.14	0.42	MUDSTONE- medium grey, few silty laminae. Parallel bedded. Few coaly plant fronds, leaves, and roots throughout. Sharp vague rotation surface and minor core loss at base.
	295.26	0.12	SANDSTONE- medium grained, quartz/chert, dark-grey top becoming lighter to base, carbonaceous matrix, well-sorted, siliceous. Irregular surface with few vitrain fragments at top. Massive.

Dip °	DEPTH m	THICKNESS m	DESCRIPTION
Sedimentary dips up to 20°.	312.02	16.76	SANDSTONE- medium grained to 301.24, fine below; quartz/chert (70:30), light grey, locally medium grey, strongly calcareous. Massive and poorly laminated to 296.90, parallel bedded 296.90 to 297.58 cross set 298.60 to 301.23, generally parallel bedded with dips up to 20° and few ripple sets below to base. Abundant white pin burrows 297.35 to 298.66, few dark mudstone in filled pin burrows. Irregular high angle rough locally calcite lined and slickensided joint passes down core 296.11 to 296.98. Occasional locally common calcite in filled high angle inclined fractures (15 to 25°CA), top to 305.25.
	316.78	4.76	MUDSTONE/SILTSTONE/SANDSTONE/ fine to very fine-grained (50:30:20), interlaminated and thinly interlayered. Dark and light grey banded. Light grey sandstones strongly calcareous, dark grey siltstones and mudstones moderately calcareous. Abundant light and dark pin, light cuspate, few large dark burrows, few pelecypod burrows; locally bioturbated. Common small scale slumping with load casts. Sand layers commonly cross-set with erosive bases and generally gradational locally sharp eroded tops. Sand and silt layers occasionally include small mudstone brecciated stringers. Few pyritic burrows 312.08. Fine pyritic coal streak 312.13. Mud and silt layers occasionally contain disseminated pyrite. Bedding lined with .001m calcite 312.65 and 312.83. Few small pelecypod valves at 313.52.
	317.22	0.44	PASSAGE BED, SANDSTONE medium-grey/MUDSTONE silty dark and carbonaceous; interlayered. Sand layers consist of thinly interlayered fine and medium-grained sandstone. Sand layers strongly calcareous, mud layers very weakly calcareous. Few large sand filled burrows in mud layers, common brecciated angular mud fragments in 0.06 sand layer at 317.00. Sand layers have sharp eroded and locally slumped tops. Few sub vertical, ?carbonaceous roots 316.79 to 316.89. Interconnecting trellise of fine calcite in filled fractures 316.82 to 316.86 (65° to 75°CA). 317.13 to 317.20 (25° to 40°CA). Listric slickensided parting 316.88 (47°CA.), semi-polished parting 316.16 (65°CA). Listric bedding plane at base (87°CA).
2° at	318.35 318.00	1.13	SANDSTONE fine-grained, light grey, calcareous, quartz/chert (60:40) - clean and well sorted, generally massive with vague parallel bedding. 0.02 siltstone rounded lense at 318.01. ____sharp, listric, non-erosive, 2° dip._____
1° at	318. 318.55	0.26	MUDSTONE- dark and carbonaceous in top 0.09 with common

BH Nos. BP47

Dip °	DEPTH m	THICKNESS m	DESCRIPTION
			plant debris, few silt laminae below increasing in frequency to base. Non-calcareous. Rough joint at 318.56. (10°CA). Abundant fine carbonaceous plant debris.
	319.18	0.57	SILTSTONE, muddy & SANDSTONE very fine-grained 65:35, 40:60 below 318.81. Interlaminated, sand laminae, calcareous, silt and mud weakly calcareous. Parallel bedded in basal 0.19. Common cross-sets top to 318.89, 318.94 to base. Train drift 318.89 to 318.94. Very brief passage, fairly sharp base.
	320.10	0.92	SANDSTONE, fine-grained top becoming medium to base, fairly well sorted, highly calcareous, light-grey; quartz/chert (60:40). Large cross-sets, few locally common small sub-rounded mudstone clasts and fine coal streaks. Diastem at 319.97.
			sharp, sub-horizontal, slightly erosive.
2° at 320°	322.00	1.90	MUDSTONE and SILTSTONE- interlaminated 70:30 to 321.85, few silt laminae only below. Calcareous, colour banded. Common pin burrows, few pyritic worm tubes throughout. Crumpling and slumping adjacent to soft sediment microfaulting 320.15 - 320.27. Core heavily shattered along sub-vertical rough joint at 321.39; .09m core lost. Occasional disseminated pyrite. Coaly parting at base.
			fairly sharp, irregular, 5° dip.
	325.30	3.30	SANDSTONE/ medium-grained, medium-grey/ few locally common dark carbonaceous muddy and silty laminae and fine layers to 323.08. Quartz/chert(60:40), well sorted. Dark with carbonaceous matrix in top 0.10m. Common ripples and small scale cross-sets where mud laminae/layers present, large cross-sets where absent. Occasional fine coal streaks. Sub-vertical rough joint passes down core 322.36 to 322.49, rough joint at 323..02 (3 to 10°CA). Occasional polished or semi-polished calcite lined and slickensided bedding planes to 323.08 and at 323.83. Fine calcitic bedding planes and small irregular tension fractures 323.77 to 323.86. Large globose burrows 325.93 to 326.05.
	326.90	1.60	SANDSTONE, fine-grained, medium-grey/MUDSTONE silty, dark and carbonaceous. Interlaminated and thinly interlayered. 40:60 to 325.55, 60:40 below. 0.35 layer with 85% sand at 326.34. Sands weakly calcareous, muds non-calcareous. Occasional ripple cross-lamination. Crumpled with some root disturbances to 325.79. Coaly roots and thoroughly root disturbed 325.99 to 326.15. Few small occasionally

Dip o	DEPTH m	THICKNESS m	DESCRIPTION
			large sand filled burrows 325.79 to 325.99, 326.15 to base; 0.13m. bioturbated layer at 326.35. Sub-horizontal slickensided bedding planes with parallel fine calcite veining adjacent, at 325.67. Rough joint at 326.87 (10°CA)/ Abundant coal flecks and fine coaly plant debris in muddy layers. Occasional disseminated pyrite and pyritic burrows in muddy layers. Occasional, locally common small pelecypod valves to 325.99 ; (kept for identification, sample number, BP47/F7).
			sharp, slightly erosive
	327.72	0.82	MUDSTONE- silty, few silt laminae, dark and carbonaceous. Occasional burrows. Small pelecypod valve at 327.25. Common disseminated pyrite, occasional small pyrite lenses. Common vitrainous and fusainous plant debris.
	328.04	0.32	SILTSTONE/SANDSTONE very fine-grained (70:30)- interlaminated, dark grey, slightly calcareous. Common roots. Laminae sommonly crumpled and root disturbed. Thoroughly disturbed in top 0.15m.
	328.47	0.43	MUDSTONE- dark and slightly carbonaceous, poorly laminated, non-calcareous. Common fine coaly plant debris.

		0.04	COAL- bright. Partial stick. Semi-polished base, 5° dip.

Bit Nos: BP47

Dip °	DEPTH m	THICKNESS m	DESCRIPTION
	343.42	(0.34)	CORE LOSS- COAL.
			BASE OF LOWER CHAMBERLAIN SEAM
	343.47	0.05	SANDSTONE, medium-grained, quartz/chert, dark-grey with carbonaceous matrix, non-calcareous.
Sedimentary dips up to 15°.	355.60	12.13	SANDSTONE, medium-grained and moderately calcareous to 347.44, fine-grained and highly calcareous below. Quartz/chert, 60:40, well sorted. Massive and thoroughly bioturbated to 346.48, becoming well laminated below. Occasional, locally common small dark burrows to 347.90. Few local croos-sets. Generally parallel bedded with dunes and occasional diastems. Few extensive unmineralized or calcite conjugate joint pairs to 352.4 (7° to 13° CA), core badly fractured with ? slickensided calcitic joints (15 to 20° CA), 344.10 to 344.95.
			sharp, slightly irregular, erosive, 5° dip.
	361.80	6.20	MUDSTONE, dark and SILTSTONE/SANDSTONE very fine-grained 60:40, light grey, thinly interlayered. Highly calcareous throughout. Sand layers commonly have erosive bases and gradational tops. 0.22 sand layer at 356.39 with common diastems and large angular tabloid, generally flow aligned mudstone clasts. Sand layers and lenses occasionally cross-set or containing angular mudstone clasts. Few, locally common small light and dark burrows. Sand layers commonly crumpled and slumped, mudstone layers commonly contain load casts. Few pelecypod burrows below 361.25. Few low angle irregular calcitic tension fractures 361.22 to 361.30. 0.98 SANDSTONE fine-grained, well sorted, light-grey, highly calcareous, quartz lithic, parallel bedded unit with few ripple sets at top and bottom, erosive base at 358.23. 0.33 parallel bedded layer with 0.05 coarse grain sand, small calcite and mudstone clasts at erosive base 360.15. Few thin coarse and very coarse sand layers and infilled large burrows below 360.99. 0.16 very coarse sandstone at base of unit.
5° at	357.70		
			sharp, irregular, erosive
Sedimentary dips up to 15°	379.60	17.80	SANDSTONE, fine-grained, medium-grey becoming lighter down, quartz/chert 60:40, highly calcareous, well sorted. Parallel bedded with low angle dunes and few diastems. Partly bedded and massive 378.17 to 378.89. Few thin black mudstone layers up to 0.03 thick with rare sand load casts, sand filled burrows and ripple set sand lenses. Occasional horizons of small or thin layers of large sub-angular to sub-rounded flow aligned tabular mudstone clasts. 0.62 cank band, ? ferruginous, at 377.90. Two large sand

Dip o	DEPTH m	THICKNESS m	DESCRIPTION
			filled pelecypod burrows, 0.05 and 0.08 long at 374.91. Occasional calcite lined joints (17 to 27°CA). Irregular interconnecting trellise of calcite infilled fractures, general trend 37° CA, 379.08 to 379.18.
	UPPER GETHING / MIDDLE GETHING		EXTENDED PASSAGE
	401.60	22.00	MUDSTONE/SILTSTONE/SANDSTONE- fine to very fine-grained, 40:30:30 becoming 60:25:15 below 388.70. Generally thinly interlayered, occasionally interlaminated. Sand and occasionally silt commonly cross-set with erosive bases. Highly calcarous throughout. Abundant crumpling and slumping, common small dark muddy burrows, large sand filled worm and irregular extensive pelecypod burrows. Sand layers contain common small, few large angular brecciated mudstone clasts. Few large pyrite concretions up to 0.05 with calcite lined bedding planes at 387.40. Occasional sand load casts in silt layers. Occasional fine carbonaceous plant debris.
			BASE OF BOREHOLE.
